

DRV8809/10 Combination Motor Drivers With DC-DC Converters

1 Features

- Configurable to Eight Modes of Combination Motor Driver
 - Bipolar Stepper Motor Driver
 - 16-Step Current-Mode Control
 - 800-mA Average Output Current as Stepper Motor Drive
 - DC Motor Driver
 - 800-mA Maximum Continuous Current and 8-A/500-ns or 3-A/100-ms Peak Current for Each DC Motor Drive
 - Low ON resistance $R_{ds(ON)} = 0.55 \Omega$ at $T_J = 25^\circ\text{C}$ (Typ)
- Three Integrated DC-DC Converters
 - On/Off Selectable Using C_SELECT Pin and Serial Interface
 - Outputs Programmable With External Resistor Network From 1.5 V to $V_{DIN} \times 0.8$
 - 1.5-A Output Capability for All Three Channels
- 7-V to 40-V Operating Voltage Range for DC-DC Converters
- Two Serial Interfaces for Communications
- Thermally Enhanced Surface-Mount 64-Pin QFP PowerPAD™ Package (Eco-Friendly – RoHS and No Sb/Br)
- Power-Down Function (Deep-Sleep Mode)
- Reset Signal Output (Active Low)
- Reset (All Clear) Control Input

2 Applications

- Printers
- Document Scanners
- POS
- Copiers

3 Description

The DRV8809/DRV8810 provides an integrated motor driver solution. The chip has four H-bridges internally and is configurable to eight different modes of combination motor driver control.

The output driver block for each H-bridge consists of N-channel power MOSFETs configured as full H-bridges to drive the motor windings. The stepper motor control has a 16-step mode programmable through the 3-wire serial interface (SPI). The SPI input pins are 3.3-V compatible and 5-V tolerant.

The DRV8809/DRV8810 has three DC-DC switch-mode buck converters to generate a programmable output voltage from 1.5 V to 80% of V_{DIN} (channel A) or up to 10 V (for channel B and channel C), with up to 1.5-A load current capability. The outputs are selected using the C_SELECT terminal at start-up or using serial interface during operation.

An internal shutdown function is provided for overcurrent protection (OCP), short-circuit protection, overvoltage/undervoltage lockout (UVLO), and thermal shutdown (TSD). Also, the device has a reset function that operates at power on and at input to the In-Reset pin.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV8809	HTQFP (64)	10.00 mm x 10.00 mm
DRV8810		

(1) For all available packages, see the orderable addendum at the end of the datasheet.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V _M	Supply voltage ⁽¹⁾		50	V
	Logic input voltage range, serial I/F inputs, and reset ⁽²⁾	-0.3	5.5	V
	Continuous total power dissipation ($\theta_{JA} = 20^{\circ}\text{C/W}$)		4	W
	Continuous motor-drive output current for each H-bridge (100 ms)		3	A
	Peak motor-drive output current for each H-bridge (500 ns)		8	A
	Continuous DC-DC converter output current		1.5	A
	Continuous DC-DC converter output current ODB, C in parallel mode		3.0	A
T _J	Operating junction temperature range (1 h)	0	150	°C
	Lead temperature 1.6 mm (1/16 in) from case for 10 s		260	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The negative spike less than -5 V and narrower than 50-ns duration should not cause any problem.

6.2 Handling Ratings

		MIN	MAX	UNIT	
T _{stg}	Storage temperature range	-65	150	°C	
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	-2	2	kV
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	-500	500	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

	MIN	NOM	MAX	UNIT
Supply voltage, V _M for motor control	18	27	40	V
Supply voltage for DC-DC converter (VDIN) ⁽¹⁾	7	27	40	V
Average output current for motor driver for each H-bridge			800	mA
DC output current for DC-DC converter			1.2	A
DC output current for DC-DC in Ch-B/C parallel mode			2.4	A
Operating ambient temperature ⁽²⁾	-40		50	°C
Operating junction temperature	0		120	°C

- (1) VDIN should be connected to VM externally.
- (2) If the total power is less than 4 W, then the operating ambient temperature range is -40°C to 60°C.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		DRV8809	UNIT
		HTQFP	
		64 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	26.2	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	12.6	
R _{θJB}	Junction-to-board thermal resistance	10.4	
ψ _{JT}	Junction-to-top characterization parameter	0.3	
ψ _{JB}	Junction-to-board characterization parameter	10.3	
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	0.5	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

6.5 Electrical Characteristics

 $T_J = 0^\circ\text{C}$ to 120°C , $V_M = 7\text{ V}$ to 40 V (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY (SLEEP) CURRENT						
I_{SLEEP1}	Supply (sleep) current 1	nSLEEP = L, DC-DC all off		4	5	mA
I_{SLEEP2}	Supply (sleep) current 2	nSLEEP = L, $V_M = 8\text{ V}$, Full duty cycle		7	10	mA
I_{SLEEP3}	Supply (sleep) current 3	nSLEEP = L, $V_M = 40\text{ V}$, Full duty cycle		8	10	mA
DIGITAL INTERFACE CIRCUIT						
V_{IH}	Digital high-level input voltage	Digital inputs ⁽¹⁾	2		5	V
I_{IH}	Digital high-level input current	Digital inputs			100	μA
V_{IL}	Digital low-level input voltage	Digital inputs			0.8	V
I_{IL}	Digital low-level input current	Digital inputs			100	μA
V_{hys}	Digital input hysteresis	Digital inputs	0.3	0.45	0.6	V
T_{degl}	Digital input deglitch time	In-Reset	2.5		7.5	μs
CHARGE-PUMP VCP ($C_P = 0.1\ \mu\text{F}$ to $0.47\ \mu\text{F}$, $C_{\text{bk}} = 0.01\ \mu\text{F} \pm 10\%$)						
$V_{\text{O(CP)}}$	Output voltage	$I_{\text{LOAD}} = 0\text{ mA}$, $V_M > V_{\text{th}}V_{\text{M2}}$	$V_M + 10$		$V_M + 13$	V
$f_{\text{(CP)}}$	Switching frequency			1.6		MHz
t_{start}	Start-up time	$C_{\text{Storage}} = 0.1\ \mu\text{F}$, $V_M \geq 16\text{ V}$		0.5	2	ms
INTERNAL CLOCK OSC1						
f_{OSCI}	System clock frequency		5.76	6.4	7.04	MHz
VREF INPUT						
V_{REF}	Reference voltage input		0.8	2.5	3.6	V
$I_{\text{leak-vr}}$	Input leak current				1	μA
C_SELECT FOR DC-DC START-UP SELECTION (DCDC_MODE = L)						
Vcs0	DC-DC all off		0		0.3	V
Vcs1	DC-DC all off	Pull down by external 200-k Ω resistor	1.3		2	V
Vcs2	Turn on ODA then ODB and ODC	As pin open	3		3.3	V
C_SELECT FOR DC-DC START-UP SELECTION (DCDC_MODE = H OR OPEN, CH-B/C PARALLEL MODE)						
Vcs0	DC-DC all off		0		0.3	V
Vcs1	Turn on ODB/C then ODA	Pull down by external 200-k Ω resistor	1.3		2	V
Vcs2	Turn on ODA then ODB/C	As pin open	3		3.6	V
THREE DC-DC CONVERTERS⁽²⁾						
V_{DINOPE}	Operating supply voltage	Ratio to $V_{\text{OUT(DC)}}$		$1.25 = V_{\text{O}}$		V
ODA ODB ODC	VoutA = 1.5 V – 30 V, VoutB/C = 1.5 V – 10 V, Programmable with external reference on FBX $\times \text{VDIN} > 1.25 \times \text{Vout}$ (largest)	$20\text{ V} \leq \text{VDIN} < 40\text{ V}$	–3%	V_{O}	3%	
		$6.5\text{ V} \leq \text{VDIN} < 20\text{ V}$	–3%	V_{O}	5%	
		$V_{\text{th}}V_{\text{M-}} < \text{VDIN} < 6.5\text{ V}$, $V_{\text{O}} \leq 3.3\text{ V}$	–3%	V_{O}	5%	
V_{FB}	FBX feedback voltage	For ODA/B/C		1.50		V
$I_{\text{O ODx}}$	ODx output current (dc)	With external L and C			1.5	A
$I_{\text{O ODBC}}$	OD _{BC} output current (DC) in Ch-B/Ch-C parallel mode	With external L and C DCDC_MODE = H			3	A
$I_{\text{O ODx2}}$	Output current (dc) at low VDIN	VDIN = 7 V, $V_{\text{O}} = 5\text{ V}$			0.8	A
$I_{\text{O ODx3}}$	Output current (dc) at low VDIN	VDIN = 7 V, $V_{\text{O}} = 3.3\text{ V}$			1.5	A
f_{OSCD}	Switching (chopping frequency)	$f_{\text{OSCD}} = (0,0)$	90	100	110	kHz
$R_{\text{ds(ON)}}$	FET ON resistance at 0.8 A for OD_x	$T_J = 25^\circ\text{C}$		0.35		Ω
		$T_J = 120^\circ\text{C}$			0.50	

(1) Absolute maximum rating for charge-pump circuit is 60 V.

(2) DCDC_MODE = H, Ch-B and Ch-C are in parallel driving mode.

Electrical Characteristics (continued)

 $T_J = 0^\circ\text{C to } 120^\circ\text{C}$, $V_M = 7\text{ V to } 40\text{ V}$ (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
5 V-Low	5.5-V V_O at $VDIN = V_{th}V_-$	$VDIN = V_{th}V_-$, $V_{th}V_- = 5\text{-V load (dc)}$ $= 0.5\text{ A}^{(3)}$	4			V
	V_O voltage to 5.5 V		-30%			
	V_O voltage drop from $VDIN$				1	V
V_{O_min6}	V_O setting without kick UVP when $VDIN = V_{th}V_{M+}$ (V_O setting at $VDIN = 10\text{ V}$)	$V_{th}V_{M+} = 6\text{-V load (DC)} = 0.5\text{ A}^{(4)}$	6			V
THREE DC-DC CONVERTER PROTECTION						
$I_{O_DD_ODx}$	Overcurrent detect for OD_x source	Peak current in each ON cycle	1.8		3	A
t_{FILT_OCP}	OCP filtering time	By OSC_i cycles		2		cycles
t_{ODSD}	DC-DC shutdown filter	Number of subsequent chopping cycles with OCP detection		4		chop cycles
V_{ovpx}	Overvoltage protection (OVP)	Percentage of nominal V_{outx} detected at VFB	25%	30%	35%	
V_{uvpx}	Undervoltage protection (UVP)	Percentage of nominal V_{outx} detected at VFB (VFB decreasing)	-25%	-30%	-35%	
$t_{Vfilter}$	OVP/UVP filtering time		3	8	13	us
t_{sst}	Start-up time with soft start				56	ms
V_{stover}	Start-up overshoot	Ratio to V_O			3%	
V_M SUPERVISORY						
$V_{th}V_{M-}$	nORT for V_M low threshold	V_M decreasing	4.5	5	6	V
$V_{th}V_{M+}$	nORT for V_M high threshold	V_M increasing	5.5	6	7	V
$V_{th}V_{Mh}$	nORT for V_M detect hysteresis	$(V_{th}V_{M+}) - (V_{th}V_{M-})$	0.5	1		V
$V_{th}V_{M2}$	For motor driver off ⁽⁵⁾				15	V
$t_{VM\ filter}$	V_M monitor filtering time	For V_M threshold detect	10		30	μs
THERMAL SHUTDOWN (TSD)						
T_{TSD}	Thermal shutdown set points		150	170	190	°C
TEMPERATURE SENSE, PRE TSD (See Extended Setup Register Definition)						
T_{TSD0}	Temperature sense point 0	Register selectable, Assert logic H at TH_OUT	130	150	170	°C
T_{TSD1}	Temperature sense point 1	Register selectable, Assert logic H at TH_OUT	120	140	160	°C
T_{c_sens}	TH_OUT (analog out) temperature coefficient	Specified by design		6		mV/°C
RESET/NORT: OPEN-DRAIN OUTPUTS (NORT, LOGIC_OUT, TH_OUT)						
V_{OH}	High-state voltage	$R_L = 1\text{ k}\Omega$ to 3.3 V	3			V
V_{OL}	Low-state voltage	$R_L = 1\text{ k}\Omega$ to 3.3 V			0.3	V
I_{OL}	Low-state sink current	$V_O = 0.4\text{ V}$	3			mA
t_r	Rise time	10% to 90%			1	μs
t_f	Fall time	90% to 10%			50	ns
RESET/NORT DELAY: START-UP SEQUENCE						
t_{ord1}	nORT delay 1	Reset deassertion from $V_{th}V_{M+} < VDIN$ for DC-DC wake up falling		300	390	ms
t_{ord3}	DC-DC turnon delay	From one DC-DC wake up to following DC-DC to go soft-start sequence		1.7		ms
t_{ord4}	nORT delay 4	Reset deassertion from 2nd DC-DC wake up		120	180	ms

(3) Lower $VDIN$ decrease gate drive and the voltage drop is increased. Specified by bench characterization only.

(4) V_{OUT} (at $VDIN = V_{th}V_{M+}$) is lower than V_O setting. When $VDIN$ is down to $V_{th}V_{M+}$, undervoltage protection (UVP) shuts down the device, in case the V_O is set as $V_O > 7\text{ V}$. Specified by design.

(5) No nORT assertion to $V_{th}V_{M2}$ detection

Electrical Characteristics (continued)
 $T_J = 0^\circ\text{C}$ to 120°C , $V_M = 7\text{ V}$ to 40 V (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
In-Reset						
t_{reset}	In-Reset assertion to nORT assertion delay	In-Reset falling to nORT failing		5	10	μs
H-BRIDGE DRIVERS (OUTX+ AND OUTX-)						
$I_{\text{OUT1(max)}}$	Peak output current 1	Less than 500-ns period			8	A
$I_{\text{OUT2(max)}}$	Peak output current 2	Less than 100-ms period			3	A
$I_{\text{OUT(max)}}$	Average continuous output current				0.8	A
$R_{\text{ds(ON)}}$	FET ON resistance at 0.8 A	$T_J = 25^\circ\text{C}$		0.55		Ω
		$T_J = 120^\circ\text{C}$			1	
I_{CEX}	Output leakage current	$V_{\text{OUTX}} = 0\text{ V}$ or 10 V			10	μA
I_{RS}	Sense resistor supply current	nORT = Low			15	μA
$I_{\text{OC Motor}}$	Motor overcurrent threshold for each H-bridge ⁽⁶⁾		3		5	A
t_{filterM}	Motor overcurrent filter time		2.5	5	8.5	μs
f_{OSCM}	Motor oscillator frequency	$F_{\text{OSCM}} = (0,0)$	720	800	880	kHz
f_{chop}	Motor chopping frequency = $f_{\text{OSCM}}/8$	$F_{\text{OSCM}} = (0,0)$	90	100	110	kHz
STEPPER MOTOR DRIVE (PARAMETERS ARE TESTED WITHOUT MOTOR LOADING)						
$I_{\text{STEPMOTORAVG}}$	Average stepper motor current for H-bridge	$V_M = 40\text{ V}$			800	mA
$I_{\text{STEPMOTORPeak}}$	Peak stepper motor current for H-bridge	$V_M = 40\text{ V}$			1.3	A
	Stepper motor current limit threshold (internal reference) ⁽⁷⁾	VL_{16} , Phase angle = 90°			100%	
		VL_{15} , Phase angle = 84°			100%	
		VL_{14} , Phase angle = 79°			98%	
		VL_{13} , Phase angle = 73°			96%

7 Detailed Description

7.1 Overview

The DRV8809/DRV8810 provides an integrated motor driver solution. The chip has four H-bridges internally and is configurable to eight different modes of combination motor driver control. The output driver block for each H-bridge consists of N-channel power MOSFETs configured as full H-bridges to drive the motor windings. Their $R_{ds(on)}$ is low, 0.55 ohm at $T_j = 25\text{ C}$, it allows 800 mA maximum continuous current and 3 A @ 100 ms peak current. The stepper motor control has a 16-step mode programmable through the three-wire serial interface (SPI). The SPI input pins are 3.3-V compatible and 5-V tolerant. The DRV8809/DRV8810 has three DC-DC switch-mode buck converters to generate a programmable output voltage from 1.5 V to 80% of V_{DIN} (Channel A) or up to 10 V (for Channel B and Channel C), with up to 1.5-A load current capability. Their $R_{ds(on)}$ is low, 0.35 ohm only at $T_j = 25\text{ C}$. The outputs are selected using the C_SELECT terminal at start-up or using serial interface during operation. An internal shutdown function is provided for overcurrent protection (OCP), short-circuit protection, overvoltage/undervoltage lockout (UVLO), and thermal shutdown (TSD). Also, the device has a reset function that operates at power on and at input to the In-Reset pin.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Serial Interface

The device has two serial interface circuit blocks for stepper motor driving control. These two serial interfaces provide controls to each motor driver independently.

CLKAB	Serial clock for H-bridge A, B
DATAAB	Serial data for H-bridge A, B
STROBEAB	Strobe input for H-bridge A, B
CLKCD	Serial clock for H-bridge C, D
DATA CD	Serial data for H-bridge C, D
STROBE CD	Strobe signal for H-bridge C, D

Sixteen bits serial data is shifted into the least significant bit (LSB) of the serial data input (DATA) shift register on the falling edge of the serial clock (CLK). After 16 bits of data transfer, the strobe signal (Strobe) rising edge latches all the shifted data. During data transfer, Strobe voltage level is acceptable high or low.

Figure 5. Serial Interface

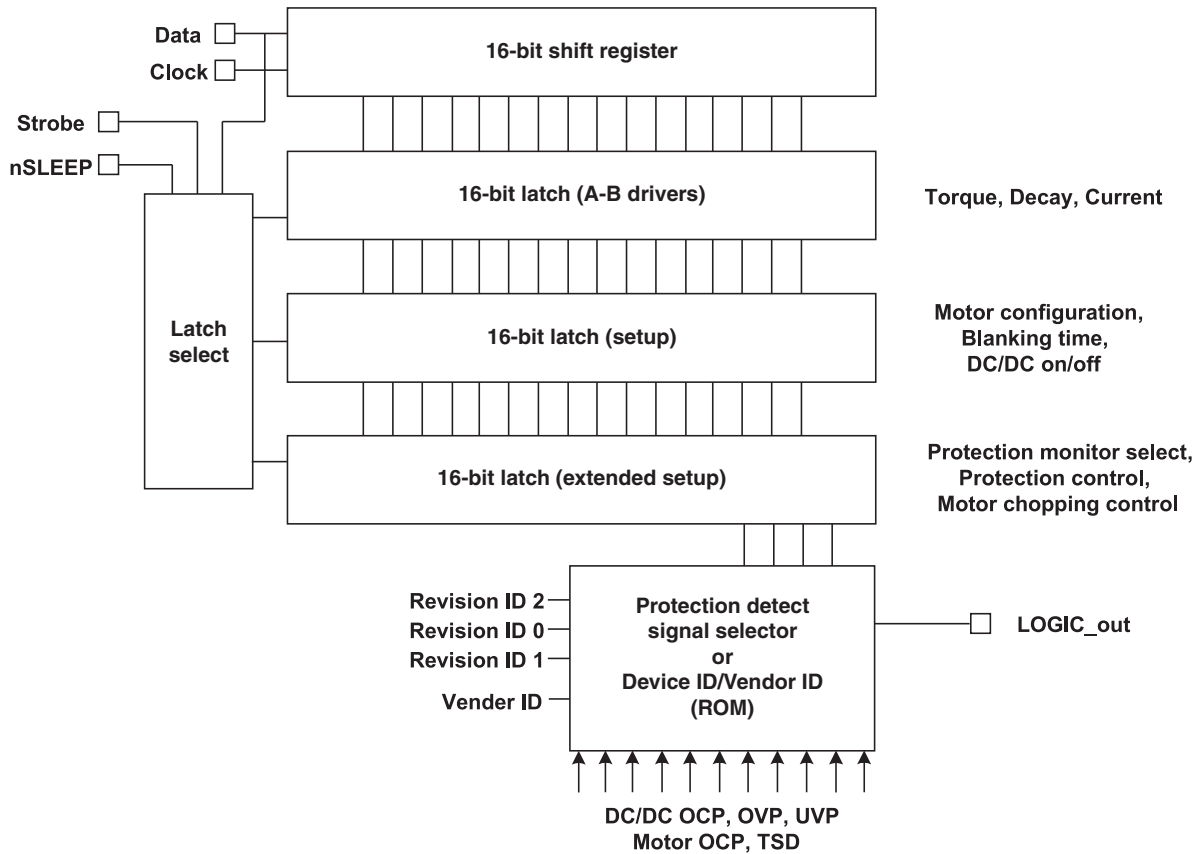

7.3.1.1 Setup Mode/Power-Down Mode

The motor output mode is configured through serial interface (DATA AB, CLK AB and STROBEAB) when nSLEEP = L. After setup, the nSLEEP pin must be pulled high for normal motor drive control. The condition that the device requires for setup (initialization) is after the nORT (Reset) output goes to high from the low level (power on, recovery from $V_M < 7$ V). While nSLEEP is low, all the motor drive functions are shut down and their outputs are high-impedance state. Also the stepper parameters in the register are all reset to 0. This device forces motor driver functions to shut down for the power-down mode, and it is not damaged even if nSLEEP is asserted during motor driving. At the Strobe pulse rising edge, the DATA signal level must be low for normal setup mode (see the [Extended Setup Mode](#) section for another option).

7.3.1.2 Extended Setup Mode

While nSLEEP = L, if the DATA signal level is set high when the Strobe pulse is set, the serial interface recognizes the input data to set the extended setup mode. This extended setup register enables monitoring and controlling the fault condition of this chip. One of the internal protection control signals is selected and provided to LOGIC OUT pin. Also, this enables the application to ignore the protection control and/or suppress the reset signal generation. This device has device ID (3-bit ROM) and vendor ID (1-bit ROM), which can be read out from LOGIC OUT. Four bits are assigned to select the LOGIC OUT signal, including the ID ROM bit readout.

Serial Interface A-B: Set A-B motor operating parameters and access to setup/extended setup register

A. A-B register at EXT-setup mode has device/vendor ID ROM. The ID must be read out at LOGIC OUT pin.

Figure 10. nSLEEP = L (Bit 16 = H): Extended Setup Mode

7.3.1.4 Bipolar Current Regulated Stepper Motor Drive

The following functionality is common to all the H-bridge drives. A crossover delay is inherent to the control circuitry to prevent cross conduction of the upper and lower switches on the same side of the H-bridge. A blanking (deglitch) time is incorporated to prevent false triggering due to initial current spikes at turnon with a discharged capacitive load.

The stepper motor current can be programmed to 16 different current levels using a 4-bit register. The average current level for a particular angular rotation is shown in [Table 1](#).

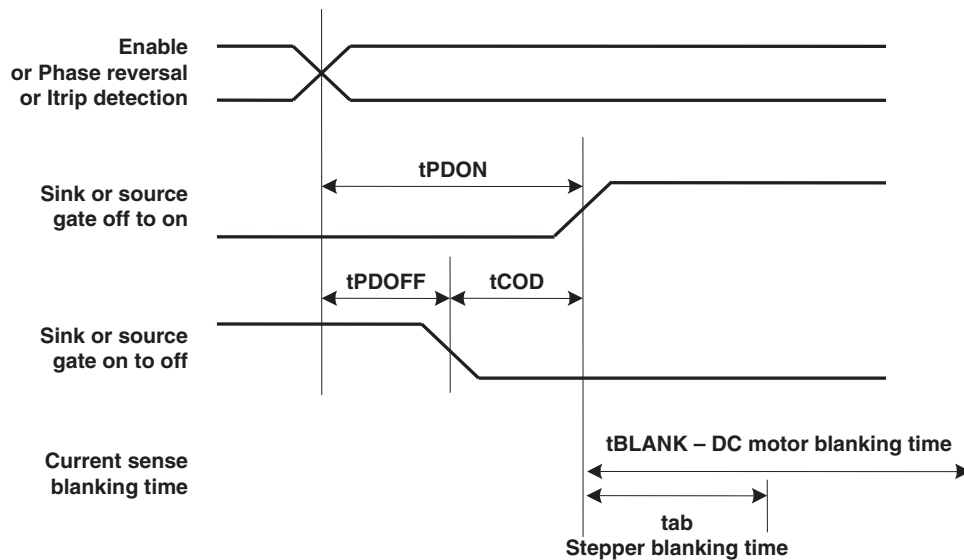

Figure 11. Crossover and Blanking Timing for H-Bridge

For stepper motor configured H-bridges, only t_{tab} (stepper blanking time) is set for current sensing. For DC motor-configured H-bridges, t_{BLANK} is included to ignore huge current spike due to rush current to varistor capacitance.

7.3.1.5 Short/Open for Motor Outputs

When a short/open situation happens, the protection circuit prevents device damage under certain conditions (short at start up, and so forth).

- A. This plot includes both actual device characterization data and extrapolated data.
- B. Actual device has self-heating effect to increase the junction temperature, with continuous loading current more than 1 A.
- C. The device temperature is set to 70°C for the $R_{ds(ON)}$ test.

Figure 13. Typical $R_{ds(ON)}$ Value vs Drain Current (DMOS FET in H-Bridge)

Figure 14. DC Motor Drive

The motor configuration setup bits in the setup register can select three types of DC motor driving: utilizing a single H-bridge, utilizing two (A and B, or C and D) H-bridges in parallel, or utilizing four H-bridges in parallel.

For the setup register value (bit 2,1,0) = (1,0,1), the device configuration is 4x DC motor, which enables each H-bridge to drive a DC motor independently. The ENABLE_x and PHASE_x input terminals are reassigned from the serial interface pins and some reserved pins, after nSLEEP pin is set to H.

For the setup register value (bit 2,1,0) = (0,1,1), the device configuration is 1x large DC + 2x DC motor mode. The large DC driving utilizes two H-bridges in parallel and controlled by ENABLE_{AB} and PHASE_{AB} pins. Two R_{sens} pins should be connected together.

The V_{REF} inputs are used for the R_{sense} comparator reference voltage. VREF_{AB} provides the voltage to both H-bridge A and B, and VREF_{CD} provides the voltage for H-bridge C and D.

Table 2. DC Motor Drive Truth Table

FAULT CONDITION	nSLEEP	ENABLE _x	PHASE _x	+ HIGH SIDE	+ LOW SIDE	- HIGH SIDE	- LOW SIDE
0	0	X	X	OFF	OFF	OFF	OFF
0	1	0	X	OFF	OFF	OFF	OFF
0	1	1	0	OFF	ON	ON	OFF
0	1	1	1	ON	OFF	OFF	ON
Motor OCP	1	X	X	OFF	OFF	OFF	OFF
TSD	X	X	X	OFF	OFF	OFF	OFF

7.3.1.6 DCDC_MODE for Parallel-Mode Control

The DCDC_MODE pin selects the DC-DC converter parallel driving for Ch-B and Ch-C. The input is pulled up to internal 3.3 V by a 200-kΩ resistor. When the pin is H or left open, Ch-B and Ch-C are driven in parallel.

Table 3. C_SELECT for Start-Up

C_SELECT	PIN VOLTAGE	DC-DC Vout1, ODA	DC-DC Vout2, ODB	DC-DC Vout3, ODC
Gnd	0 V to 0.3 V	OFF	OFF	OFF
Pull Down (by external 200 kΩ)	1.3 V to 2 V	See Table 4		
OPEN	3 V to 3.3 V	ON	ON	ON

7.3.1.7 DCDC_MODE and C_SELECT Timing Delay and Start-Up Order

DCDC_MODE and C_SELECT play a role in the order of regulator enablement, as well as the time when the first regulator is enabled to when the second is enabled. Regulators B and C are always enabled together, whether they are working in parallel mode or not.

Table 4. DCDC_MODE and C_SELECT Timing Delay (DRV8809)

DCDC_MODE	C_SELECT	TIMING DELAY	DESCRIPTION
L	GND	None	No regulator is enabled.
L	Pull down	None	No regulator is enabled.
L	3 V to 3.3 V	1.6 ms	Ch-A followed by Ch-B and Ch-C
H	GND	None	No regulator is enabled.
H	Pull down	1.6 ms	Ch-B and Ch-C followed by Ch-A
H	3 V to 3.3 V	1.6 ms	Ch-A followed by Ch-B and Ch-C

Table 5. DCDC_MODE and C_SELECT Timing Delay (DRV8810)

DCDC_MODE	C_SELECT	TIMING DELAY	DESCRIPTION
L	GND	None	No regulator is enabled.
L	Pull down	None	No regulator is enabled.
L	3 V to 3.3 V	1.6 ms	Ch-A followed by Ch-B and Ch-C
H	GND	None	No regulator is enabled.
H	Pull down	20 ms to 40 ms	Ch-B and Ch-C followed by Ch-A
H	3 V to 3.3 V	20 ms to 40 ms	Ch-A followed by Ch-B and Ch-C

7.3.1.8 In-Reset: Input for System Reset

In-Reset pin assertion stops all the DC-DC converters and H-bridges. It also reset all the register contents to default value. After deassertion of the input, the device follows the initial start-up sequence. The C_SELECT state is captured after the In-Reset deassertion. The input is pulled up to internal 3.3 V by 200-kΩ resistor. When the pin = H or left open, reset function is asserted. Also it has deglitch filter of 2.5 μs to 7.5 μs.

- A. Charge-pump wake-up delay, from 10 ms to 20 ms, due to asynchronous event capture
- B. For the DRV8809, delay is 1.6 ms for both DC_MODE high and low. For the DRV8810, delay is 20 ms to 40 ms for DC_MODE high and 1.6 ms for DC_MODE low.

Figure 15. Power-Up Timing (Power Up With DC-DC Turn-On By C_SELECT)

NOTE

When V_M crosses V_{thVM+} (about 6 V), the C_select state is captured. If C_SELECT is open (pulled up to internal 3.3 V), all DC-DC regulator channels (A, B, and C) are turned on. The time of channels B and C to be turned on, with regards to channel A, depends on the state of DC_MODE.

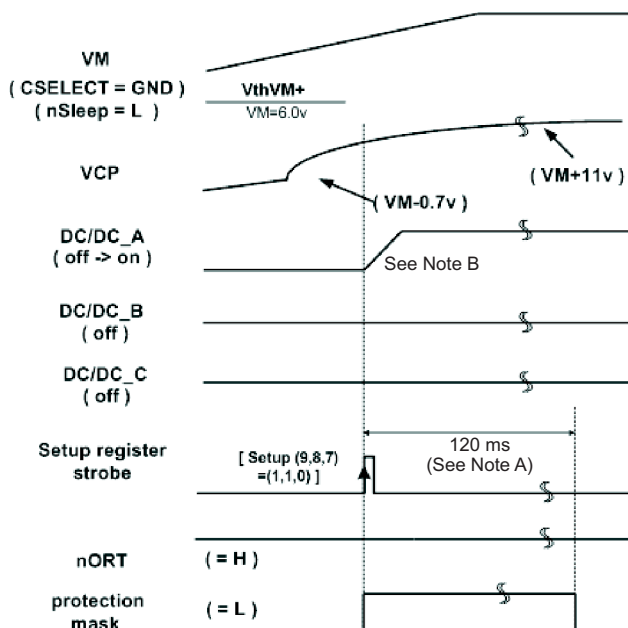

Figure 16. Power-Up Timing (Power Up Without DC-DC Turn-On: C_SELECT = GND)

NOTE

When V_M crosses $V_{thV_{M+}}$ (about 6 V) with C_SELECT = GND, none of the three regulators are turned on. The nORT output is released to H after 300 ms from the $V_{thV_{M+}}$ crossing.

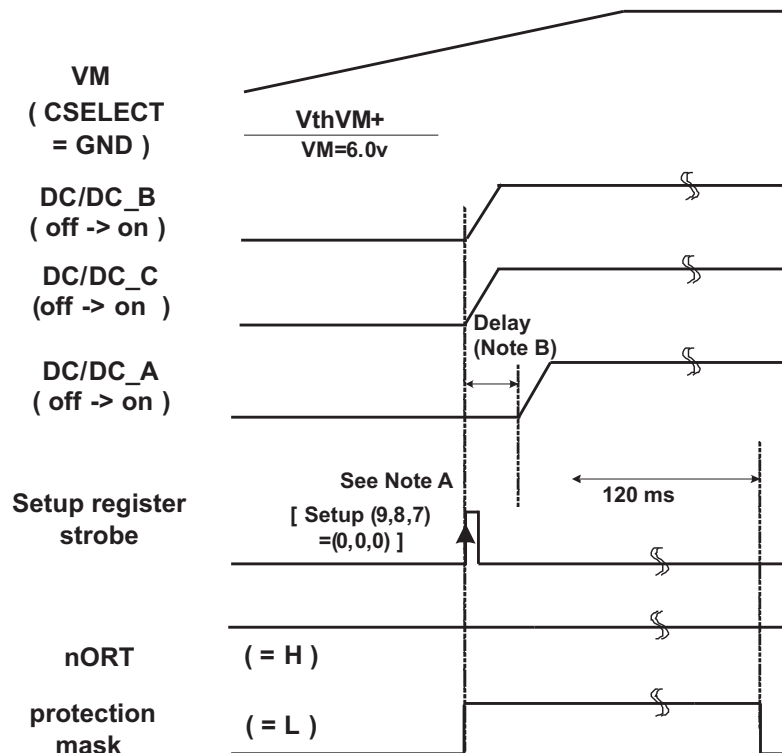

- A. 120 ms to 140 ms due to asynchronous event capture
- B. After VM power up, DC-DC starts at the setup register strobe.

Figure 17. Power-Up Timing (DC-DC Regulator Wake Up by Setup Register)

NOTE

The regulator is started from the strobe input, same as charge pump. There is no 10-ms waiting period, because VCP pin already reached $V_M - 0.7$ V.

- After VM power up, DC-DC starts at the setup register strobe.
- For the DRV8809, delay is 1.6 ms for both DC_MODE high and low. For the DRV8810, delay is 20 ms to 40 ms for DC_MODE high and 1.6 ms for DC_MODE low.

Figure 18. Power-Up Timing (DC-DC Regulator Wake Up by Setup Register, All Three Channels On)

- A. Charge-pump wake-up delay, from 10 ms to 20 ms, due to asynchronous event capture
- B. Start-up with V_M glitch (not below V_{thV-}). Only channels B and C are shown. Same applies to Channel A.

Figure 19. V_M Start-Up/Power-Down and Glitch Condition

- A. Charge-pump wake-up delay, from 10 ms to 20 ms, due to asynchronous event capture
- B. Start-up with V_M glitch (below V_{thV_-}). Only channels B and C are shown. Same applies to Channel A.

Figure 20. V_M Startup/Power-Down and Glitch Condition

Figure 24. Shutdown by In-Reset

7.3.1.9 Blanking Time Insertion Timing for DC Motor Driving

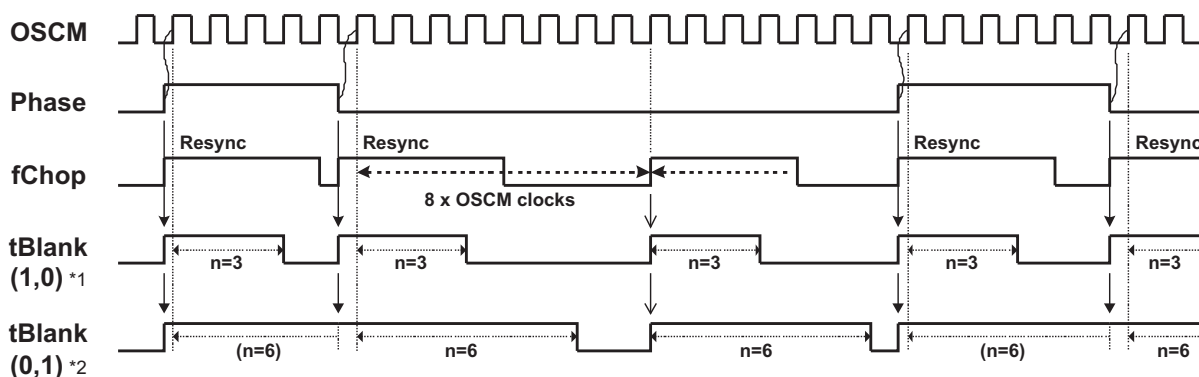

For the DC motor driving H-bridge, tBlank is inserted at each phase reversal and also following each chopping cycle (once every eight OSCM clocks).

For a large n number (5 or 6) tBlank setup may decrease the itrip detect window. The user must be careful to optimize in the system.

Case A: Phase duty = 25%

Case A*1 for setup bit = (1,0)

Case A*2 for setup bit = (0,1)

*1 : Setup register bit <4,3> = (1,0) : tBlank = OSCM clock x 3 (or bit <5,6> for H-bridge C,D channel)

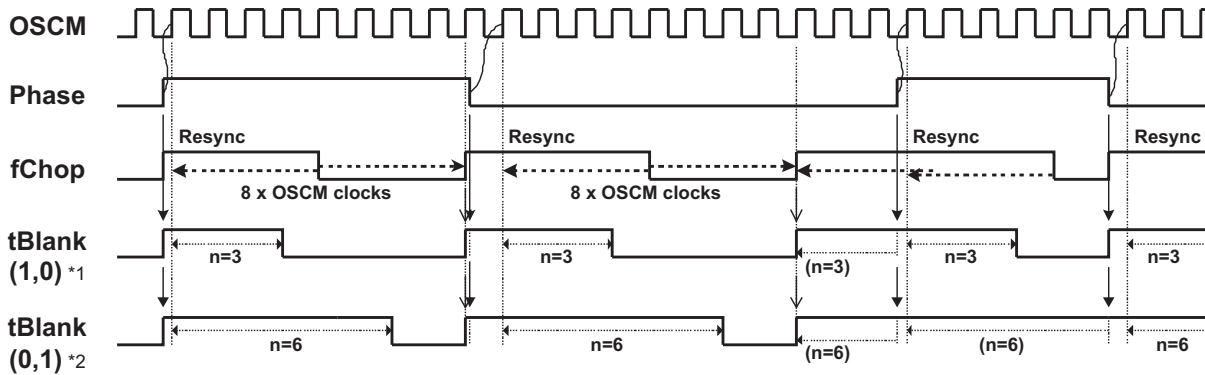

*2 : Setup register bit <4,3> = (0,1) : tBlank = OSCM clock x 6 (or bit <5,6> for H-bridge C,D channel)

Figure 25. Blanking Time Insertion Timing, Case A

Case B: Phase duty = 40%

Case B*1 for setup bit =(1,0)

Case B*2 for setup bit =(0,1)

*1 : Setup register bit <4,3> = (1,0) : tBlank = OSCM clock x 3 (or bit <5,6> for H-bridge C,D channel)

*2 : Setup register bit <4,3> = (0,1) : tBlank = OSCM clock x 6 (or bit <5,6> for H-bridge C,D channel)

Figure 26. Blanking Time Insertion Timing, Case B

Table 6. Function Table nORT, Power Down, $V_M < 4.5 V$ Conditions

DEVICE STATUS	CHARGE PUMP	OSCD	OSCM	nORT (RESET) OUTPUT	MODE SETTING
nSLEEP	Active	Active	Active	Inactive	Available
nORT	Inactive	Active	Active	Active	Depend on power down
$V_M < 6 V$ during power down	Active	Active	Active	See timing chart	Depend on power down
$4.5 V < V_M$	Inactive	Inactive	Inactive	Active	Unavailable

Table 7. Shutdown Functions

CASE OF SUPPLY SHUTDOWN	DC-DC Vout1	DC-DC Vout2	DC-DC Vout3	MOTOR	nORT (RESET)
DC-DC Vout1 OCP, OVP	Shut down	Shut down	Shut down	Shut down	Reset ON (L out)
DC-DC Vout2 OCP, OVP	Shut down	Shut down	Shut down	Shut down	Reset ON (L out)
DC-DC Vout3 OCP, OVP	Shut down	Shut down	Shut down	Shut down	Reset ON (L out)
Motor OCP	NA	NA	NA	OFF	Reset one pulse ($t_{low} = 40 ms$)
TSD	Shut down	Shut down	Shut down	Shut down	Reset ON (L out)

- Shutdown of DC-DCs is released at $V_M > V_{thV_{M+}}$ when V_M is increasing. In case V_M decreases, DC-DCs are shut down when $V_M < V_{thV_-}$. When V_M decreases and $V_{thV_{M+}} > V_M > V_{thV_-}$, the DC-DC output voltage supervisor is ignored.
- Motor shutdown is released by $V_M < 4.5 V$ or nSLEEP rising edge.
- nORT (reset) ON/OFF time is 40 ms.
- The data in Table 21 is valid if the protection control bits in the EX-setup register are all 0.

Table 8. Modes of Operation^{(1) (2)}

POR	M OFF	ISD				OVP			TSD	EXTERNAL PIN		IC	BLOCK FUNCTIONS

Figure 32. Motor Configuration 5, Four Small DCs

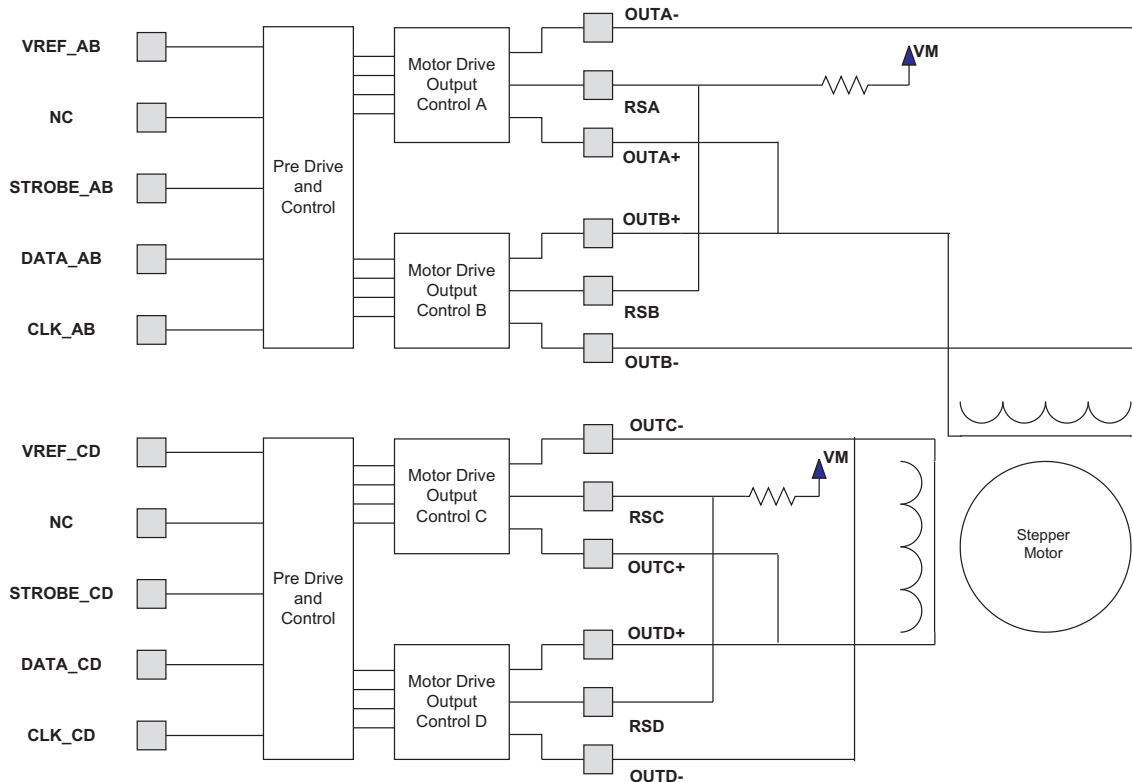

Figure 33. Motor Configuration 6, Single Large Stepper Motor

Figure 34. Motor Configuration 7, Ultra-Large DC

7.3.3 Charge Pump

The charge-pump voltage-generator circuit utilizes external storage and bucket capacitors. It provides the necessary voltage to drive the high-side switches for both DC-DC regulators and motor drivers. The charge-pump circuit is driven at a frequency of 1.6 MHz (nom). Recommended bucket capacitance is 10 nF, 16 V (min), and storage capacitance is 0.1 μ F, 60 V (min). The charge-pump storage capacitor, Cstage, should be connected from the VCP output, pin 22, to V_M .

For power-saving purposes in sleep mode, the charge pump is stopped when $n_{sleep} = L$ and all three regulators are turned OFF. When the part is powered up, the charge pump is started first after the C_select capture, and 10 ms after the CP startup, the first regulator is started up.

Table 9. Charge Pump

FAULT CONDITION	DC-DC Ch-A	DC-DC Ch-B	DC-DC Ch-C	nSLEEP	CHARGE PUMP
0	OFF	OFF	OFF	0	OFF
0	ON	X	X	X	ON
0	X	ON	X	X	ON
0	X	X	ON	X	ON
0	X	X	X	1	ON
Motor OCP	X	X	X	1	ON
TSD	X	X	X	X	OFF

Figure 35. DC-DC Converter

This is a switch-mode regulator with integrated switches, to provide a programmed output set by the feedback terminal. The DC-DC converter has a fixed frequency variable duty cycle topology with a switching frequency of 100 kHz (nom). External filtering (inductor and capacitor) and external catch diode are required. The output voltage is short-circuit protected. If the system has a high input voltage and a very light load on the output, the converter may not provide energy to the inductor (skip) until the load line or the minimum voltage threshold is reached.

The regulator has a soft-start function to limit the rush current during start up. It is achieved by using VFB ramp during soft start.

For unused DC-DC converter channels, the external components can be removed if the channel is set to inactive by the C_SELECT pin and register bits. Also, the VFB pin can be left open or connected to ground.

DCDC_MODE selector can operate channel B and C in parallel mode to handle 2x output driving capability. VFB_B pin is active for feedback, and VFB_C pin must be pulled down internally.

7.4 Device Functional Modes

7.4.1 Operation With $7\text{ V} < V_M$ and $V_{DIN} < 18\text{ V}$

The devices starts operating with input voltages above 6.0 V typ. Between 7 V and 18 V, DC-DC converters can operate. Enabling motors in not allowed.

7.4.2 Operation With $18\text{ V} \leq V_M$ and $V_{DIN} \leq 40\text{ V}$

The device can operate with full function. Both DC-DC converter and motor drivers can be enabled.

7.5 Register Maps

7.5.1 Setup Register Bit Assignment

Setup register bits are assigned for motor configuration, blanking time, gain, and DC-DC switches. This register can be accessed only in Setup mode (nSLEEP = L and bit 16 data = L) .

Table 10. Setup Register

BIT NO.	NAME	DEFAULT	DESCRIPTION
0	Motor select 0	0	Motor configuration, < 2,1,0 > (0,0,0): Stepper × 2 (default) (0,0,1): Stepper + LDC, (0,1,0): Stepper + 2 × sDCs (0,1,1): DCL + 2 × sDC, (1,0,0): DCL × 2 (1,0,1): 4 × sDC (1,1,0): Large stepper (1,1,1): Ultra-large DC
1	Motor select 1	0	
2	Motor select 2	0	
3	TBLNK AB0	0	Tblank for DC motor driving, Tblank is inserted at any phase change and beginning of each chopping cycle. AB1 AB0: Blanking time for A/B side drivers, CD1 CD0: Blanking time for C/D side drivers, 00: $(1 \div f_{\text{CHOP}}) \div 8 \times 5$ (= 6.25 μs) (default) 01: $(1 \div f_{\text{CHOP}}) \div 8 \times 6$ (= 7.50 μs) 10: $(1 \div f_{\text{CHOP}}) \div 8 \times 3$ (= 3.75 μs) 11: $(1 \div f_{\text{CHOP}}) \div 8 \times 4$ (= 5.00 μs) For stepper motor driving, only the fixed blanking time is applied.
4	TBLNK AB1	0	
5	TBLNK CD0	0	
6	TBLNK CD1	0	
7	DC/DC_A SW	0	
8	DC/DC_B SW	0	DC-DC ODB control, 0: ON (default), 1: OFF
9	DC/DC_C SW	0	DC-DC ODC control, 0: ON (default), 1: OFF This bit is ignored when DCDC_MODE = H or open
10	Motor_AB gain	0	0: 1/10 (default), 1: 0
11	Motor_CD gain	0	0: 1/10 (default), 1: 0
12	OSCD frequency 0	0	<1,0> = (0,0) 100 kHz (default) (0,1) 50 kHz (1,0) 200 kHz (1,1) 132.5 kHz These setup bits can be changed when the DC-DC regulators are in operation.
13	OSCD frequency 1	0	
14	OSCM frequency 0	0	<1,0> = (0,0) 800 kHz (default) (0,1) 400 kHz (1,0) 1.06 MHz (1,1) 1.6 MHz
15	OSCM frequency 1	0	

The device can be configured to one out of eight different motor control combination modes. When the device is powered on or is recovering from reset, the mode can be selected by writing to the setup register through the serial interface AB, during Setup mode (nSLEEP = L).

Table 11. DC and Stepper Motor Configuration

SETUP REGISTER			H-BRIDGE AND MOTOR CONFIGURATION			
BIT 2	BIT 1	BIT 0	OUTA+, OUTA–	OUTB+, OUTB–	OUTC+, OUTC–	OUTD+, OUTD–
0	0	0	Stepper motor drive		Stepper motor drive	
0	0	1	Stepper motor drive		Large DC motor drive	
0	1	0	Stepper motor drive		DC motor drive	DC motor drive
0	1	1	Large DC motor drive		DC motor drive	DC motor drive
1	0	0	Large DC motor drive		Large DC motor drive	
1	0	1	DC motor drive	DC motor drive	DC motor drive	DC motor drive
1	1	0	Large stepper motor drive: A + B for first winding, C + D for second winding			
1	1	1	Ultra-large DC motor drive			

Default setting is (M0, M1, M2) = (0, 0, 0)

Extended setup (EX-setup) register bits are assigned for protection control, pre TSD, and multiplexer test mode selection. This register can be accessed only in Setup mode (nSLEEP = L and bit 16 data = H).

Table 12. Extended Setup Register (EX-Setup) Bit Assignment

BIT NO.	NAME	DEFAULT	DESCRIPTION
0	Signal select 0	0	Signal selector monitored on LOGIC_OUT DC-DC OCP detection, DC-DC voltage supervisor (OVP or UVP), Motor overcurrent (four H-bridges), TSD, and so forth [shutdown (protection) signals must be latched]
1	Signal select 1	0	
2	Signal select 2	0	
3	Signal select 3	0	
4	Ignore SD 0	0	0 = Normal operation, 1 = Ignore DC-DC OCP
5	Ignore SD 1	0	0 = Normal operation, 1 = Ignore DC-DC voltage supervisor
6	Ignore SD 2	0	0 = Normal operation, 1 = Ignore motor OCP
7	Ignore SD 3	0	0 = Normal operation, 1 = Ignore thermal shutdown
8	Disable nORT 0 (selective shutdown for DC-DC Ch-C)	0	0 = Normal operation 1 = Disable nORT assertion but shut down DC-DC Ch-C, in case of DC-DC Ch-C fault condition Ch-C shutdown is released by nSLEEP rise edge. If fault condition is on the other channels (with bit = 0), assert nORT and shut down all three DC-DC channels. This bit is ignored when DCDC_MODE = H or open
9	Disable nORT 1 (Selective shutdown for DC-DC Ch-B)	0	0 = Normal operation 1 = Disable nORT assertion but shut down DC-DC channel B, in case of DC-DC Ch-B fault condition Ch-B shutdown is released by nSLEEP rise edge. If fault condition on the other channels (with bit = 0), assert nORT and shut down all three DC-DC channels.
10	Disable nORT 2 (Selective shutdown for DC-DC Ch-A)	0	0 = Normal operation, 1 = Disable nORT assertion but shutdown the DC-DC Ch-A, in case of DC-DC Ch-A fault condition. Ch-A shutdown is released by nSLEEP rise edge. If fault condition on the other channels (with bit is 0), assert nORT and shut down all three DC-DC channels .
11	Pre TSD 0	0	0 = Ttsd0 = Ttsd - 20°C, 1 = Ttsd1 = Ttsd - 30°C
12	Pre TSD 1	0	0 = Pre-TSD (logic) output, 1 = TH_OUT Analog output
13	Test mux 0	0	Test mode selection, < 2,1,0 > = (0,0,0) Normal operation (0,0,1) TSD control – 1, (0,1,0) TSD control – 2, (0,1,1) OSC monitor enable,
14	Test mux 1	0	
15	Test mux 2	0

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DRV8809/DRV8810 provides an integrated motor driver solution. The chip has four H-bridges internally and is configurable to eight different modes of combination motor driver control.

8.2 Typical Application

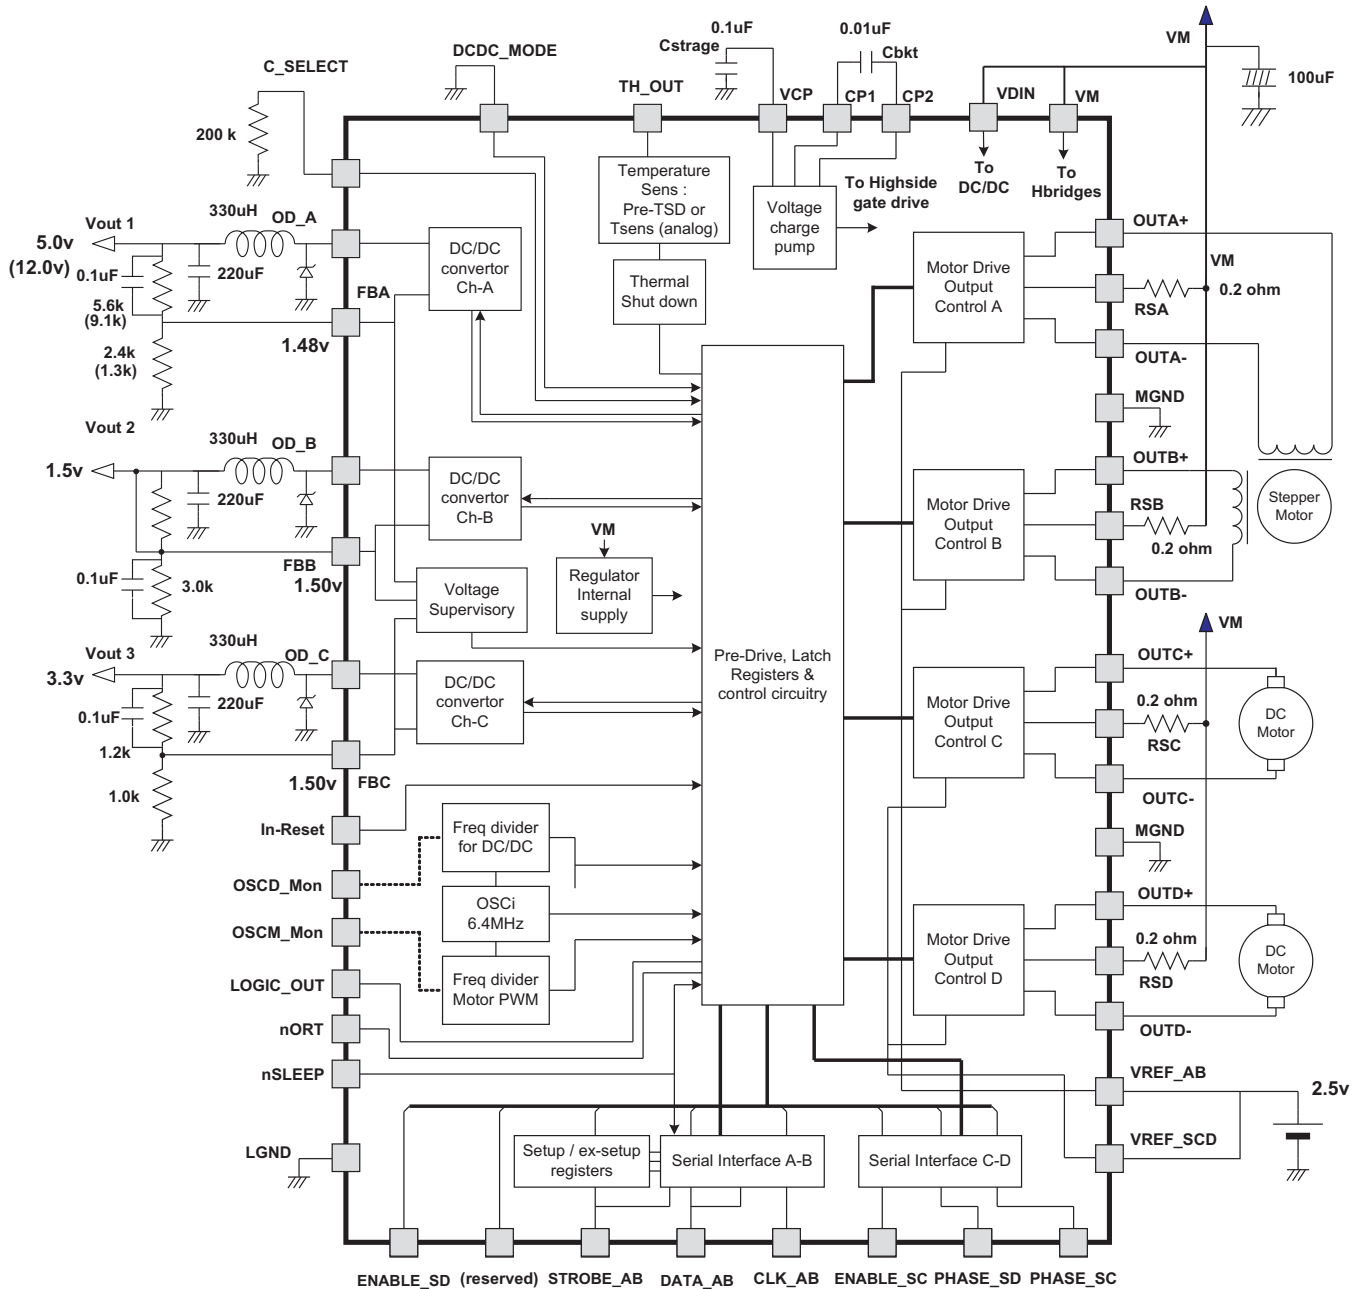

Figure 36. Application Schematic

8.2.1 Design Requirements

To begin the design process, determine the following:

1. Output voltage for each DC-DC converters
2. Output voltage start up sequence
3. Motor configuration (DC motors or stepping motors)
4. External Rsense-motor current setting for stepping motor

For one stepper and two DC motor configuration:

- DC-DC Ch-A = 5 V (12 V)

Typical Application (continued)

- DC-DC Ch-B = 1.5 V
- DC-DC Ch-C = 3.3 V

If start-up from Ch-B (1.5 V) \geq Ch-A (5 V), Ch-C 3.3 V should be turned on by the setup register (200 k Ω between C_SELECT pin and GND).

8.2.2 Detailed Design Procedure

8.2.2.1 Output Voltage for Each DC-DC Converter

Output voltage is set by external feedback resistor network. For example,

- 5.0 V Output : 5.6 K Ω and 2.4 K Ω
- 1.5 V Output : 0 Ω and 3.0 K Ω
- 3.3 V Output : 1.2 K Ω and 1.0 K Ω

8.2.2.2 Output Voltage Startup Sequence

DC-DC converters start up sequence is determined by CSELECT pin and DCDC_MODE combination. Refer to the sections [DCDC_MODE for Parallel-Mode Control](#) and [DCDC_MODE and C_SELECT Timing Delay and Start-Up Order](#) for details.

8.2.2.3 Motor Configuration

Motor configuration is set by SPI register setting. Ramp up device with nSLEEP = Low, then write Setup Register Bits 0 to 3 for motor configuration. Refer to [Table 11](#) for details.

$$I(\text{max}) = V_{\text{REF}} * \text{Gain} / R_{\text{Sense}} \quad (1)$$

VREF input is typically 2.5V. For example, if Rsense = 5 ohm and Torque (Bit 0 to 1) = 100%

$$I(\text{max}) = 2.5\text{V} * 100\% / 5\text{ohm} \quad (2)$$

$$= 500\text{mA}$$

8.2.2.4 External Rsense-Motor Current Setting for Stepping Motor

Stepping motor current level is determined by external Rsense value.

8.2.3 Application Curves

Die temperature can be monitored at TH_OUT pin when register is set as Tsense(analog). This is used for evaluation purposes only. Typical characteristics are shown in [Figure 37](#).

Figure 37. Tsense (Analog Out) Voltage Plot Example

9 Power Supply Recommendations

This device requires a single voltage supply only. Supply to VM and VDIN pins should be the same voltage. VDIN and VM should be connected externally.

10 Layout

10.1 Layout Guidelines

- VDIN and VM should be connected externally
- Recommended to have GND plane layer for better thermal performance. Thermal pad directly going down to GND layer just under the device is the best way.
- VM is an analog sensing pin, not a power supply. Monitor the voltage between VM and RSx pin.
- Distance between Odx to Inductance should be as close as possible. This line has switching from 0 V to VDIN.
- FBx pin and external feedback resistor should be as close as possible. This is the analog sensing pin for the DC-DC converter.

10.2 Layout Example

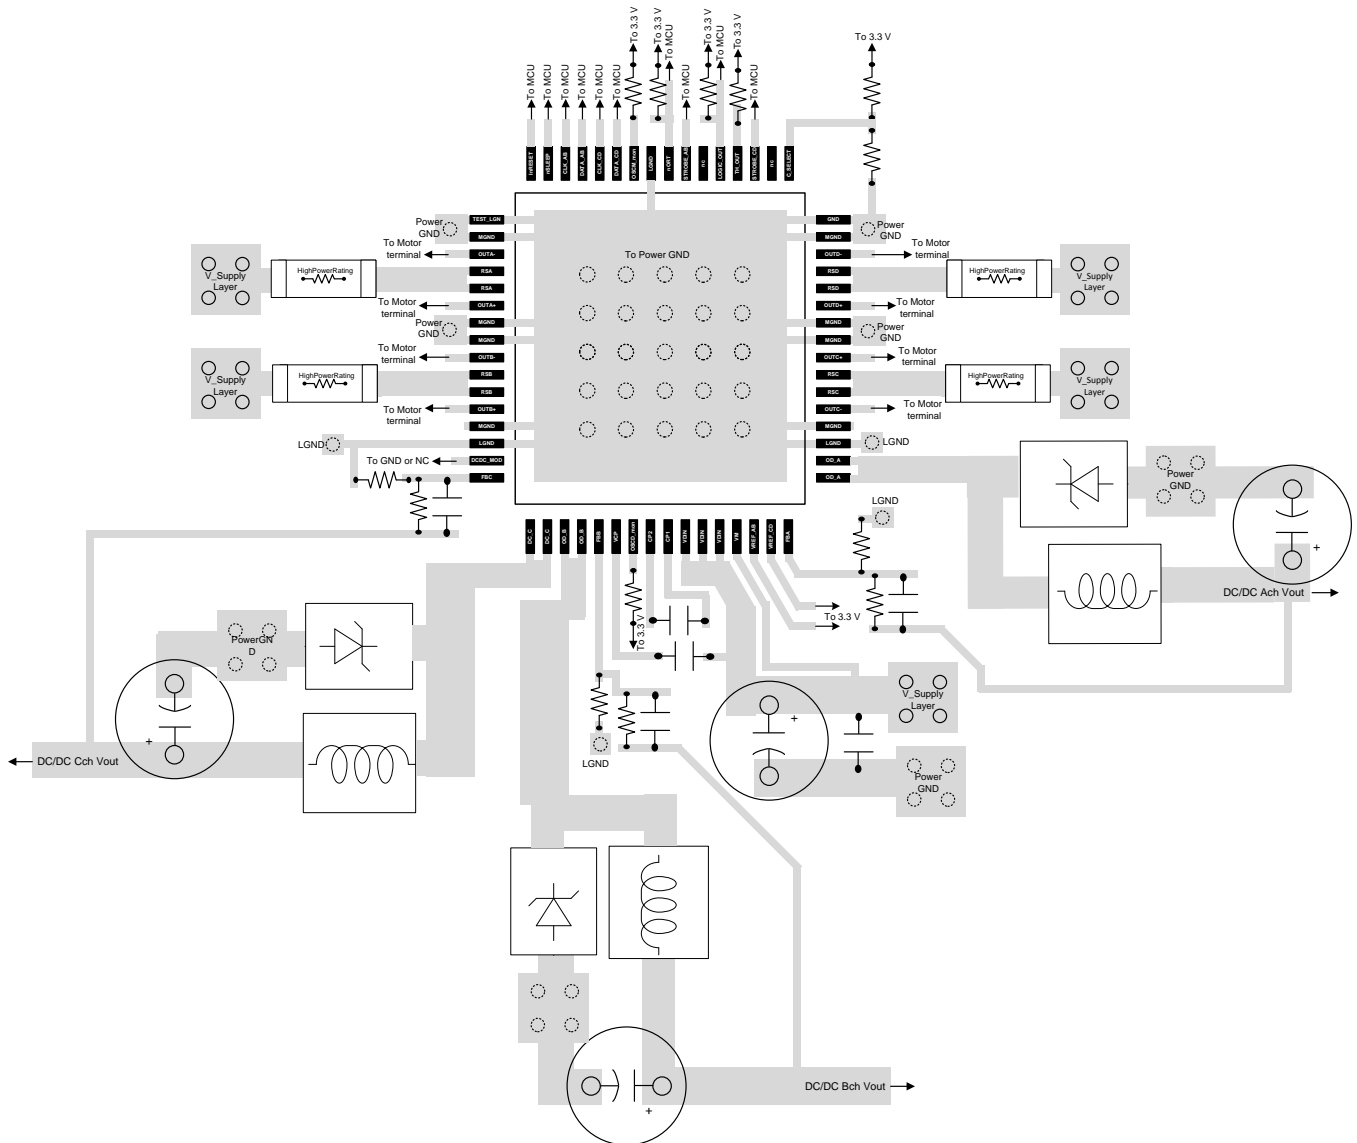

Figure 38. Layout

11 Device and Documentation Support

11.1 Device Support

11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

11.2 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

11.3 Trademarks

PowerPAD is a trademark of Texas Instruments Inc.
All other trademarks are the property of their respective owners.

11.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV8809PAP	ACTIVE	HTQFP	PAP	64	160	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR	-10 to 50	DRV8809 1	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

THERMAL PAD MECHANICAL DATA

PAP (S-PQFP-G64)

PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

4206326-2/P 05/14

NOTES: A. All linear dimensions are in millimeters

 Tie strap features may not be present.

LAND PATTERN DATA

PAP (S-PQFP-G64)

PowerPAD™ PLASTIC QUAD FLATPACK

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
- PowerPAD is a trademark of Texas Instruments**

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
