

# FULLY-INTEGRATED, 8-CHANNEL ANALOG FRONT-END FOR ULTRASOUND

## 0.89nV/ $\sqrt{\text{Hz}}$ , 12-Bit, 40MSPS, 101mW/Channel

Check for Samples: [AFE5804](#)

### FEATURES

- **8-Channel Complete Analog Front-End:**
  - LNA, VCA, PGA, LPF, and ADC
- **Mode Control for Power/Noise Optimization:**
  - **Low Noise (Full-Channel):**  
0.89nV/ $\sqrt{\text{Hz}}$  (TGC Mode I)  
1.23nV/ $\sqrt{\text{Hz}}$  (TGC Mode II)  
1.03nV/ $\sqrt{\text{Hz}}$  (PW Mode)
  - **Ultra-Low Power:**  
101mW/Channel (TGC Mode II)  
65mW/Channel (CW Mode)
- **Low-Noise Pre-Amp (LNA):**
  - 0.75nV/ $\sqrt{\text{Hz}}$
  - 20dB Fixed Gain
  - 280mV<sub>PP</sub> Linear Input Range
- **Variable-Gain Amplifier:**
  - Gain Control Range: 46dB
- **PGA Gain Settings: 20dB, 25dB, 27dB, 30dB**
- **Low-Pass Filter:**
  - Selectable BW: 12.5MHz, 17MHz
  - 2nd-Order, Bessel
- **Gain Error:  $\pm 0.5\text{dB}$**
- **Channel Matching:  $\pm 0.25\text{dB}$**
- **Clamping**
- **Fast Overload Recovery: Two Clock Cycles**
- **12-Bit Analog-to-Digital Converter:**
  - 10MSPS to 50MSPS
  - 69dB SNR at 10MHz
  - Serial LVDS Interface
- **Integrated CW Switch Matrix**
- **15mm × 9mm, 135-BGA Package:**
  - Pb-Free (RoHS-Compliant) and Green

### APPLICATIONS

- **Medical Imaging, Ultrasound**
  - Portable Systems
  - Battery-Powered Systems

### DESCRIPTION

The AFE5804 is a complete analog front-end device specifically designed for ultrasound systems that require low power and small size.

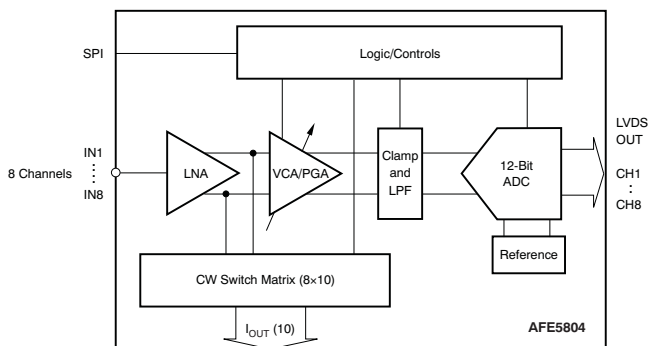

The AFE5804 consists of eight channels, including a low-noise amplifier (LNA), voltage-controlled attenuator (VCA), programmable gain amplifier (PGA), low-pass filter (LPF), and a 12-bit analog-to-digital converter (ADC) with low voltage differential signaling (LVDS) data outputs.

The LNA gain is set for 20dB gain and has excellent noise and signal handling capabilities, including fast overload recovery. VCA gain can vary over a 46dB range with a 0V to 1.2V control voltage common to all channels of the AFE5804.

The PGA can be programmed for gains of 20dB, 25dB, 27dB, and 30dB. The internal low-pass filter can also be programmed to 12.5MHz or 17MHz.

The LVDS outputs of the ADC reduce the number of interface lines to an ASIC or FPGA, thereby enabling the high system integration densities desired for portable systems. The ADC can either be operated with internal or external references. The ADC also features a signal-to-noise ratio (SNR) enhancement mode that can be useful at high gains.

The AFE5804 is available in a 15mm × 9mm, 135-ball BGA package that is Pb-free (RoHS-compliant) and green. It is specified for operation from 0°C to +85°C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Infineon is a registered trademark of Infineon Technologies.

All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### PACKAGING/ORDERING INFORMATION<sup>(1) (2)</sup>

PRODUCT	PACKAGE-LEAD	PACKAGE DESIGNATOR	OPERATING TEMPERATURE RANGE	ORDERING NUMBER	TRANSPORT MEDIA, QUANTITY	ECO STATUS
AFE5804	µFBGA-135	ZCF	0°C to +85°C	AFE5804ZCFR	Tape and Reel, 1000	Pb-Free, Green
				AFE5804ZCFT	Tape and Reel, 250	
				AFE5804ZCF	Tray, 160	

- (1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](http://www.ti.com).
- (2) These packages conform to Lead (Pb)-free and green manufacturing specifications. Additional details including specific material content can be accessed at [www.ti.com/leadfree](http://www.ti.com/leadfree).  
 GREEN: TI defines Green to mean Lead (Pb)-Free and in addition, uses less package materials that do not contain halogens, including bromine (Br), or antimony (Sb) above 0.1% of total product weight. N/A: Not yet available Lead (Pb)-Free; for estimated conversion dates, go to [www.ti.com/leadfree](http://www.ti.com/leadfree). Pb-FREE: TI defines Lead (Pb)-Free to mean RoHS compatible, including a lead concentration that does not exceed 0.1% of total product weight, and, if designed to be soldered, suitable for use in specified lead-free soldering processes.

### ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Over operating free-air temperature range, unless otherwise noted.

	AFE5804	UNIT	
Supply voltage range, AVDD1	–0.3 to +3.9	V	
Supply voltage range, AVDD2	–0.3 to +3.9	V	
Supply voltage range, AVDD_5V	–0.3 to +6	V	
Supply voltage range, DVDD	–0.3 to +3.9	V	
Supply voltage range, LVDD	–0.3 to +2.2	V	
Voltage between AVSS1 and LVSS	–0.3 to +0.3	V	
Voltage at analog inputs	–0.3 to minimum [3.6, (AVDD2 + 0.3)]	V	
External voltage applied to REFT-pin	–0.3 to +3	V	
External voltage applied to REFB-pin	–0.3 to +2	V	
Voltage at digital inputs	–0.3 to minimum [3.9, (AVDD2 + 0.3)]	V	
Peak solder temperature <sup>(2)</sup>	+260	°C	
Maximum junction temperature, T <sub>J</sub>	+125	°C	
Storage temperature range	–55 to +150	°C	
Operating temperature range	0 to +85	°C	
ESD ratings	HBM	2000	V
	CDM	750	V
	MM	150	V

- (1) Stresses above these ratings may cause permanent damage. Exposure to *absolute maximum conditions* for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not supported.
- (2) Device complies with JSTD-020D.

## ELECTRICAL CHARACTERISTICS

At AVDD\_5V = 5.0V, AVDD1 = AVDD2 = DVDD = 3.3V, LVDD = 1.8V, TGC mode I, single-ended input into LNA, ac-coupled (1.0μF), V<sub>CNTL</sub> = 1.0V, f<sub>IN</sub> = 5MHz, Clock = 40MSPS, 50% duty cycle, LPF = 12.5MHz, internal reference mode, ISET = 56kΩ, LVDS buffer setting = 3.5mA, and ambient temperature T<sub>A</sub> = +25°C, unless otherwise noted.

PARAMETER	TEST CONDITIONS	AFE5804			UNIT	
		MIN	TYP	MAX		
<b>PREAMPLIFIER (LNA)</b>						
Gain	A	SE-input to differential output	20		dB	
Input voltage (TGC, PW modes)	V <sub>IN</sub>	Linear operation (HD2 ≤ 40dB)	280		mV <sub>PP</sub>	
(CW mode)		Linear operation	220		mV <sub>PP</sub>	
Maximum input voltage		Limited by internal diodes	600		mV <sub>PP</sub>	
Input voltage noise (TGC)	e <sub>n</sub> (RTI)	R <sub>S</sub> = 0Ω, f = 2MHz	0.75		nV/√Hz	
Input current noise	I <sub>n</sub> (RTI)	TGC mode I	3		pA/√Hz	
		TGC mode II	1.7		pA/√Hz	
Common-mode voltage, input	V <sub>CMi</sub>	Internally generated	2.4		V	
Bandwidth	BW	Small-signal, -3dB	55		MHz	
Input resistance	R <sub>IN</sub>	At 2.5MHz	8		kΩ	
Input capacitance	C <sub>IN</sub>	Includes internal ESD and clamping diodes	16		pF	
<b>FULL-SIGNAL CHANNEL (LNA + VCA + LPF + ADC)</b>						
Input voltage noise (TGC mode I)	e <sub>n</sub>	R <sub>S</sub> = 0Ω, f = 2MHz, PGA = 30dB	0.89		nV/√Hz	
Input voltage noise (TGC mode II)		R <sub>S</sub> = 0Ω, f = 2MHz, PGA = 30dB	1.23		nV/√Hz	
Input voltage noise (PW mode)		R <sub>S</sub> = 0Ω, f = 2MHz, PGA = 30dB	1.03		nV/√Hz	
Noise figure	NF	R <sub>S</sub> = 200Ω, f = 2MHz	1.1		dB	
Low-pass filter bandwidth	LPF	At -3dB, selectable through SPI	12.5, 17		MHz	
Bandwidth tolerance			±10		%	
High-pass filter	HPF	(First-order, due to internal ac-coupling)	200		kHz	
Group delay variation		1MHz to 10MHz	±3		ns	
Overload recovery		≤ 6dB overload to within 3%, V <sub>CNTL</sub> = 0V to 1.2V	2		Clock Cycles	
<b>ACCURACY</b>						
Gain (PGA)		Selectable through SPI	20, 25, 27, 30		dB	
Total gain, max <sup>(1)</sup>		LNA + PGA gain, V <sub>CNTL</sub> = 1.2V	47.5	49	50.5	dB
Gain range		V <sub>CNTL</sub> = 0V to 1.2V		46		dB
		V <sub>CNTL</sub> = 0.1V to 1.0V		40		dB
Gain error, absolute <sup>(2)</sup>		0V < V <sub>CNTL</sub> < 0.1V		±0.5		dB
		0.1V < V <sub>CNTL</sub> < 1.0V	-1.5	±0.5	+1.5	dB
		1.0V < V <sub>CNTL</sub> < 1.2V		±0.5		dB
Gain matching		Channel-to-channel	-0.5	±0.25	+0.5	dB
Offset error		V <sub>CNTL</sub> = 1.2V, PGA = 30dB	-39		+39	LSB
Offset error drift (tempco)				±5		ppm/°C
Clamp level		Level internally fixed before LPF	2.3			V <sub>PP</sub>
<b>GAIN CONTROL (VCA)</b>						
Input voltage range	V <sub>CNTL</sub>	Gain range = 46dB		0 to 1.2		V
Gain slope		V <sub>CNTL</sub> = 0.1V to 1.0V		44.4		dB/V
Input resistance				25		kΩ
Response time		V <sub>CNTL</sub> = 0V to 1.2V step; to 90% signal		0.5		μs

(1) Excludes digital gain within ADC.

(2) Excludes error of internal reference.

## ELECTRICAL CHARACTERISTICS (continued)

At AVDD\_5V = 5.0V, AVDD1 = AVDD2 = DVDD = 3.3V, LVDD = 1.8V, TGC mode I, single-ended input into LNA, ac-coupled (1.0μF), V<sub>CNTL</sub> = 1.0V, f<sub>IN</sub> = 5MHz, Clock = 40MSPS, 50% duty cycle, LPF = 12.5MHz, internal reference mode, ISET = 56kΩ, LVDS buffer setting = 3.5mA, and ambient temperature T<sub>A</sub> = +25°C, unless otherwise noted.

PARAMETER	TEST CONDITIONS	AFE5804			UNIT	
		MIN	TYP	MAX		
<b>DYNAMIC PERFORMANCE</b>						
Signal-to-noise ratio	SNR	f <sub>IN</sub> = 2MHz; –1dBFS (V <sub>CNTL</sub> = 1.0V, PGA = 30dB)		59.7		dBFS
		f <sub>IN</sub> = 5MHz; –1dBFS		59.5		dBFS
		f <sub>IN</sub> = 10MHz; –1dBFS		59.1		dBFS
Second-harmonic distortion	HD2	f <sub>IN</sub> = 5MHz; –1dBFS (V <sub>CNTL</sub> = 0.35V, PGA = 30dB)		–45		dBFS
		f <sub>IN</sub> = 5MHz; –1dBFS (V <sub>CNTL</sub> = 1V, PGA = 30dB)	–50	–70		dBFS
		f <sub>IN</sub> = 5MHz; –6dBFS (V <sub>CNTL</sub> = 1V, PGA = 20dB)	–61	–70		dBFS
Third-harmonic distortion	HD3	f <sub>IN</sub> = 5MHz; –1dBFS (V <sub>CNTL</sub> = 0.35V, PGA = 30dB)		–43		dBFS
		f <sub>IN</sub> = 5MHz; –1dBFS (V <sub>CNTL</sub> = 1V, PGA = 30dB)	–43	–50		dBFS
		f <sub>IN</sub> = 5MHz; –6dBFS (V <sub>CNTL</sub> = 1V, PGA = 20dB)	–61	–70		dBFS
Intermodulation distortion	IMD3	f <sub>1</sub> = 4.99MHz at –6dBFS, f <sub>2</sub> = 5.01MHz at –32dBFS		58		dBc
Crosstalk		f <sub>IN</sub> ≤ 5MHz, V <sub>CNTL</sub> = 0.6V, –6dBFS		–67		dBc
<b>CW—SIGNAL CHANNELS</b>						
Input voltage noise (CW)	e <sub>n</sub>	R <sub>S</sub> = 0Ω, f = 2MHz		1.1		nV/√Hz
Output noise correlation factor		Summing of eight channels		0.6		%
Output transconductance	I <sub>OUT</sub> /V <sub>IN</sub>	At V <sub>IN</sub> = 100mV <sub>PP</sub>		13.8		mA/V
		At V <sub>IN</sub> = 270mV <sub>PP</sub>		12.2		mA/V
Dynamic CW output current, max	I <sub>OUTAC</sub>			2.9		mA <sub>PP</sub>
Static CW output current (sink)	I <sub>OUTDC</sub>			0.9		mA
Output common-mode voltage <sup>(3)</sup>	V <sub>CM</sub>			2.5		V
Output impedance				50		kΩ
Output capacitance				10		pF
<b>INTERNAL REFERENCE VOLTAGES (ADC)</b>						
Reference top	V <sub>REFT</sub>			0.5		V
Reference bottom	V <sub>REFB</sub>			2.5		V
V <sub>REFT</sub> – V <sub>REFB</sub>			1.95	2	2.05	V
Common-mode voltage (internal)	V <sub>CM</sub>		1.425	1.5	1.575	V
V <sub>CM</sub> output current				±2		mA

(3) CW outputs require an externally applied bias voltage of +2.5V.

**ELECTRICAL CHARACTERISTICS (continued)**

At AVDD\_5V = 5.0V, AVDD1 = AVDD2 = DVDD = 3.3V, LVDD = 1.8V, TGC mode I, single-ended input into LNA, ac-coupled (1.0µF), V<sub>CNTL</sub> = 1.0V, f<sub>IN</sub> = 5MHz, Clock = 40MSPS, 50% duty cycle, LPF = 12.5MHz, internal reference mode, ISET = 56kΩ, LVDS buffer setting = 3.5mA, and ambient temperature T<sub>A</sub> = +25°C, unless otherwise noted.

PARAMETER	TEST CONDITIONS	AFE5804			UNIT	
		MIN	TYP	MAX		
<b>EXTERNAL REFERENCE VOLTAGES (ADC)</b>						
Reference top	VREFT	2.4	2.5	2.6	V

- (4) Current drawn by the eight ADC channels from the external reference voltages; sourcing for VREFT, sinking for VREFB.  
 (5) Programmable power affects on the front-end; ADC power consumption remains constant at about 57mW/channel for 40MSPS.  
 (6) ADC powered-down during CW mode.  
 (7) At VCA\_PD pin pulled high; see also [Power-Down Timing](#) diagram.

## DIGITAL CHARACTERISTICS

DC specifications refer to the condition where the digital outputs are not switching, but are permanently at a valid logic level '0' or '1'. At  $C_{LOAD} = 5\text{pF}^{(1)}$ ,  $I_{OUT} = 3.5\text{mA}^{(2)}$ ,  $R_{LOAD} = 100\Omega^{(2)}$ , and no internal termination, unless otherwise noted.

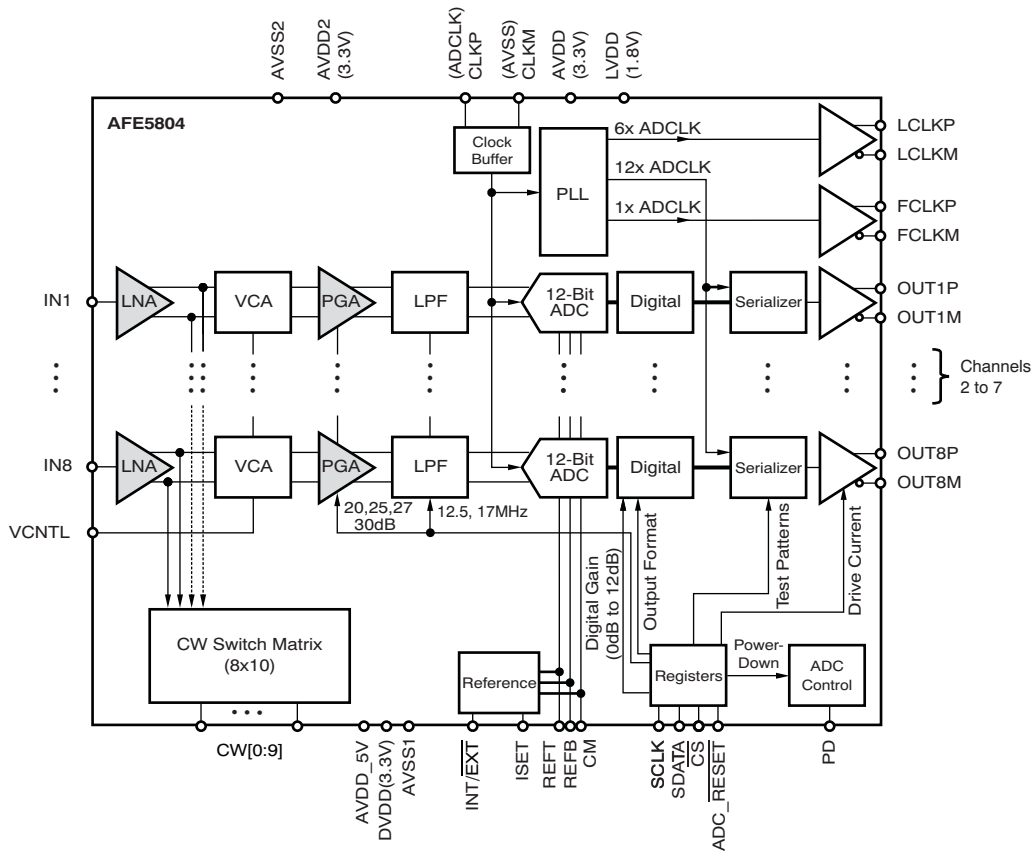

PARAMETER	TEST CONDITIONS	AFE5804			UNIT
		MIN	TYP	MAX	
<b>DIGITAL INPUTS</b>					
High-level input voltage		1.4		3.3	V
Low-level input voltage		0		0.3	V
High-level input current			10		$\mu\text{A}$
Low-level input current <sup>(3)</sup>			–10		$\mu\text{A}$
Input capacitance			3		pF
<b>LVDS OUTPUTS</b>					
High-level output voltage			1375		mV
Low-level output voltage			1025		mV
Output differential voltage, $ V_{OD} $			350		mV
$V_{OS}$ output offset voltage <sup>(2)</sup>	Common-mode voltage of OUTP and OUTM		1200		mV
Output capacitance	Output capacitance inside the device, from either output to ground		2		pF
FCLKP and FCLKM		10	1x (clock rate)	50	MHz
LCLKP and LCLKM		60	6x (clock rate)	300	MHz
<b>CLOCK</b>					
Clock input rate		10		50	MSPS
Clock duty cycle			50		%
Clock input amplitude, differential (VCLKP – VCLKM)	Sine-wave, ac-coupled		3		$V_{PP}$
	LVPECL, ac-coupled		1.6		$V_{PP}$
	LVDS, ac-coupled		0.7		$V_{PP}$
Clock input amplitude, single-ended (VCLKP)					
High-level input voltage, $V_{IH}$	CMOS	2.2			V
Low-level input voltage, $V_{IL}$	CMOS			0.6	V

(1)  $C_{LOAD}$  is the effective external single-ended load capacitance between each output pin and ground.

(2)  $I_{OUT}$  refers to the LVDS buffer current setting;  $R_{LOAD}$  is the differential load resistance between the LVDS output pair.

(3) Except pin J3 (INT/EXT), which has an internal pull-up resistor (52k $\Omega$ ) to 3.3V.

E1	CW7	Output	CW output 7
D1	CW8	Output	CW output 8
C1	CW9	Output	CW output 9
L9	EN_SM	Input	Enables access to the VCA register. Active high. Connect permanently to 3.3V (AVDD1).
N8	FCLKM	Output	LVDS frame clock (negative output)
N9	FCLKP	Output	LVDS frame clock (positive output)
A1	IN1	Input	LNA input Channel 1
A2	IN2	Input	LNA input Channel 2
A3	IN3	Input	LNA input Channel 3
A4	IN4	Input	LNA input Channel 4
A9	IN5	Input	LNA input Channel 5
A8	IN6	Input	LNA input Channel 6
A7	IN7	Input	LNA input Channel 7
A6	IN8	Input	LNA input Channel 8
J3	INT/EXT	Input	Internal/ external reference mode select for ADS; internal = high
K9	ISET	Input	Current bias pin for ADS. Requires 56k $\Omega$ to ground.
N2	LCLKM	Output	LVDS bit clock (6x); negative output
N1	LCLKP	Output	LVDS bit clock (6x); positive output
R4	OUT1M	Output	LVDS data output (negative), Channel 1
P4	OUT1P	Output	LVDS data output (positive), Channel 1
R3	OUT2M	Output	LVDS data output (negative), Channel 2
P3	OUT2P	Output	LVDS data output (positive), Channel 2
R2	OUT3M	Output	LVDS data output (negative), Channel 3
P2	OUT3P	Output	LVDS data output (positive), Channel 3

**Table 1. TERMINAL FUNCTIONS (continued)**

PIN NO.	PIN NAME	FUNCTION	DESCRIPTION
R1	OUT4M	Output	LVDS data output (negative), Channel 4
P1	OUT4P	Output	LVDS data output (positive), Channel 4
R6	OUT5M	Output	LVDS data output (negative), Channel 5
P6	OUT5P	Output	LVDS data output (positive), Channel 5
R7	OUT6M	Output	LVDS data output (negative), Channel 6
P7	OUT6P	Output	LVDS data output (positive), Channel 6
R8	OUT7M	Output	LVDS data output (negative), Channel 7
P8	OUT7P	Output	LVDS data output (positive), Channel 7
R9	OUT8M	Output	LVDS data output (negative), Channel 8
P9	OUT8P	Output	LVDS data output (positive), Channel 8
J9	REFB	Input/Output	0.5V Negative reference of ADS. Decoupling to ground. Becomes input in external ref mode.
J8	REFT	Input/Output	2.5V Positive reference of ADS. Decoupling to ground. Becomes input in external ref mode.
H5	RST	Input	RESET input for VCA. Connect to the VCA_ $\overline{\text{CS}}$ pin (H4).
H4	VCA_ $\overline{\text{CS}}$	Output	Connect to RST–pin (H5)
F2	VB1	Output	Internal bias voltage. Bypass to ground with 2.2 $\mu\text{F}$ .
D8	VB2	Output	Internal bias voltage. Bypass to ground with 0.1 $\mu\text{F}$ .
E3	VB3	Output	Internal bias voltage. Bypass to ground with 0.1 $\mu\text{F}$ .

Figure 1. LVDS Timing Diagram

Figure 2. Definition of Setup and Hold Times

**TIMING CHARACTERISTICS<sup>(1)</sup>**

PARAMETER	TEST CONDITIONS	AFE5804			UNIT
		MIN	TYP	MAX	
$t_{D(A)}$	ADC aperture delay	1.5		4.5	ns
	Aperture delay variation		±20		ps
$t_J$	Aperture jitter		400		$f_s$ , rms
$t_{WAKE}$	Wake-up time				
	Time to valid data after coming out of COMPLETE POWER-DOWN mode		50		µs
	Time to valid data after coming out of PARTIAL POWER-DOWN mode (with clock continuing to run during power-down)		2		µs
	Time to valid data after stopping and restarting the input clock		40		µs
	Data latency		12		Clock cycles

(1) Timing parameters are ensured by design and characterization; not production tested.

## LVDS OUTPUT TIMING CHARACTERISTICS<sup>(1) (2)</sup>

Typical values are at +25°C, minimum and maximum values over specified temperature range of  $T_{MIN} = 0^{\circ}C$  to  $T_{MAX} = +85^{\circ}C$ , sampling frequency = as specified,  $C_{LOAD} = 5pF^{(3)}$ ,  $I_{OUT} = 3.5mA$ ,  $R_{LOAD} = 100\Omega^{(4)}$ , and no internal termination, unless otherwise noted.

PARAMETER	TEST CONDITIONS <sup>(5)</sup>	AFE5804						UNIT			
		40MSPS			50MSPS						
		MIN	TYP	MAX	MIN	TYP	MAX				
$t_{SU}$	Data setup time <sup>(6)</sup>	Data valid <sup>(7)</sup> to zero-crossing of LCLKP			0.67			0.47			ns
$t_{H}$	Data hold time <sup>(6)</sup>	Zero-crossing of LCLKP to data becoming invalid <sup>(7)</sup>			0.85			0.65			ns
$t_{PROP}$	Clock propagation delay	ADC input clock rising edge cross-over to output clock (FCLKP) rising edge cross-over			10	14	16.6	10	12.5	14.1	ns
	LVDS bit clock duty cycle	Duty cycle of differential clock, (LCLKP – LCLKM)			45.5	50	53	45	50	53.5	
	Bit clock cycle-to-cycle jitter		250					250			ps, pp
	Frame clock cycle-to-cycle jitter		150					150			ps, pp
$t_{RISE}, t_{FALL}$	Data rise time, data fall time	Rise time is from –100mV to +100mV Fall time is from +100mV to –100mV			0.09	0.2	0.4	0.09	0.2	0.4	ns
$t_{CLKRISE}, t_{CLKFALL}$	Output clock rise time, output clock fall time	Rise time is from –100mV to +100mV Fall time is from +100mV to –100mV			0.09	0.2	0.4	0.09	0.2	0.4	ns

- (1) All characteristics are at the maximum rated speed for each speed grade.
- (2) Timing parameters are ensured by design and characterization; not production tested.
- (3)  $C_{LOAD}$  is the effective external single-ended load capacitance between each output pin and ground.
- (4)  $I_{OUT}$  refers to the LVDS buffer current setting;  $R_{LOAD}$  is the differential load resistance between the LVDS output pair.
- (5) Measurements are done with a transmission line of 100 $\Omega$  characteristic impedance between the device and the load.
- (6) Setup and hold time specifications take into account the effect of jitter on the output data and clock. These specifications also assume that data and clock paths are perfectly matched within the receiver. Any mismatch in these paths within the receiver would appear as reduced timing margin.
- (7) Data valid refers to a logic high of +100mV and a logic low of –100mV.

## LVDS OUTPUT TIMING CHARACTERISTICS<sup>(1) (2)</sup>

Typical values are at +25°C, minimum and maximum values over specified temperature range of  $T_{MIN} = 0^{\circ}C$  to  $T_{MAX} = +85^{\circ}C$ , sampling frequency = as specified,  $C_{LOAD} = 5pF^{(3)}$ ,  $I_{OUT} = 3.5mA$ ,  $R_{LOAD} = 100\Omega^{(4)}$ , and no internal termination, unless otherwise noted.

**Figure 91.**

## SERIAL INTERFACE

The AFE5804 has a set of internal registers that can be accessed through the serial interface formed by pins  $\overline{CS}$  (chip select, active low), SCLK (serial interface clock), and SDATA (serial interface data). When  $\overline{CS}$  is low, the following actions occur:

- Serial shift of bits into the device is enabled
- SDATA (serial data) is latched at every rising edge of SCLK
- SDATA is loaded into the register at every 24th SCLK rising edge

If the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active  $\overline{CS}$  pulse. The first eight bits form the register address and the remaining 16 bits form the register data. The interface can work with SCLK frequencies from 20MHz down to very low speeds (a few hertz) and also with a non-50% SCLK duty cycle.

### Register Initialization

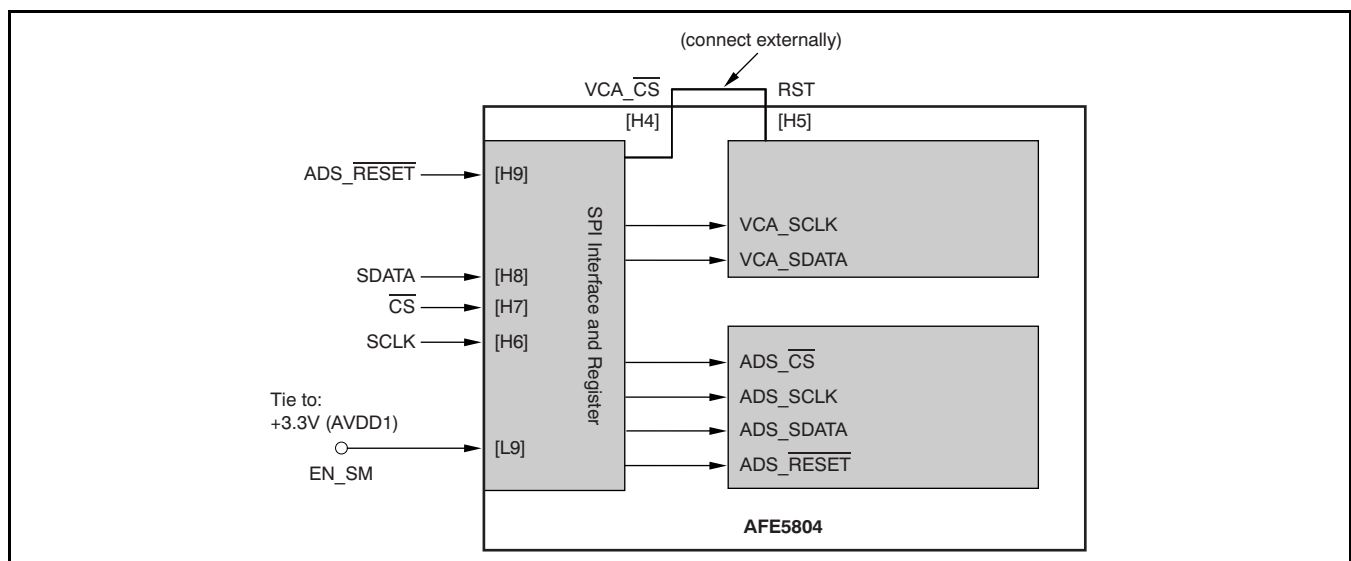

After power-up, the internal registers **must** be initialized to the respective default values. Initialization can be done in one of two ways:

1. Through a hardware reset, by applying a low-going pulse on the ADS\_ $\overline{RESET}$  pin; or
2. Through a software reset; using the serial interface, set the S\_RST bit high. Setting this bit initializes the internal registers to the respective default values and then self-resets the bit low. In this case, the ADS\_ $\overline{RESET}$  pin stays high (inactive).
3. The registers in [Table 2](#) must be programmed after the initialization stage. The power-supply ripple and clock jitter effects can be minimized.

**Table 2. Register Data**

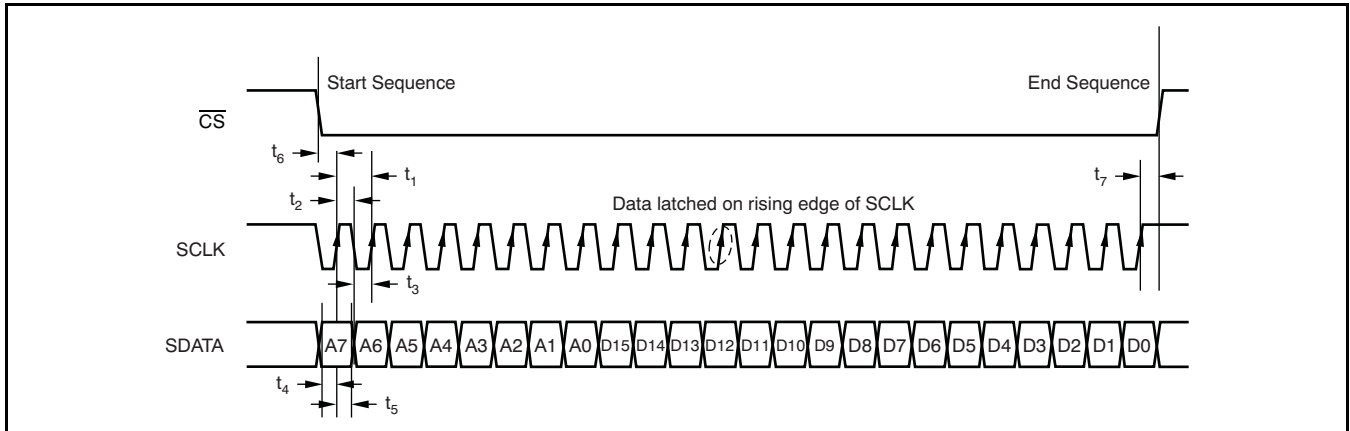

ADDRESS	DATA

### Serial Port Interface (SPI) Information

**Figure 92. Typical Connection Diagram for the SPI Control Lines**

**SERIAL INTERFACE TIMING**

PARAMETER	DESCRIPTION	AFE5804			UNIT
		MIN	TYP	MAX	
$t_1$	SCLK period	50			ns
$t_2$	SCLK high time	20			ns
$t_3$	SCLK low time	20			ns
$t_4$	Data setup time	5			ns
$t_5$	Data hold time	5			ns
$t_6$	$\overline{CS}$ fall to SCLK rise	8			ns
$t_7$	Time between last SCLK rising edge to $\overline{CS}$ rising edge	8			ns

**Internally-Generated VCA Control Signals**

VCA\_SCLK and VCA\_SDATA signals are generated if:

- Registers with address 16, 17, or 18 (hex) are written to, and
- EN\_SM pin is HIGH

- (1) The unused bits in each register (identified as blank table cells) must be programmed as '0'.
- (2) X = Register bit referenced by the corresponding name and description (default setting is listed in table).
- (3) Bits marked as '0' should be forced to 0, and bits marked as '1' should be forced to 1 when the particular register is programmed.
- (4) Multiple functions in a register should be programmed in a single write operation.

**Table 3. SUMMARY OF FUNCTIONS SUPPORTED BY SERIAL INTERFACE<sup>(1) (2) (3) (4)</sup> (continued)**

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME	DESCRIPTION	DEFAULT
2A									X	X	X	X	X	X	X	X	GAIN_CH4<3:0>	Programmable gain channel 4.	0dB gain
																	GAIN_CH3<3:0>	Programmable gain channel 3.	0dB gain
					X	X	X	X									GAIN_CH2<3:0>	Programmable gain channel 2.	0dB gain
	X	X	X	X													GAIN_CH1<3:0>	Programmable gain channel 1.	0dB gain
2B	X	X	X	X													GAIN_CH5<3:0>	Programmable gain channel 5.	0dB gain
					X	X	X	X									GAIN_CH6<3:0>	Programmable gain channel 6.	0dB gain
									X	X	X	X					GAIN_CH7<3:0>	Programmable gain channel 7.	0dB gain
													X	X	X	X	GAIN_CH8<3:0>	Programmable gain channel 8.	0dB gain
42	1								1							X	DIFF_CLK	Differential clock mode.	Single-ended clock
	1								1					X			EN_DCC	Enables the duty-cycle correction circuit.	Disabled
	1								1			X					EXT_REF_VCM	Drives the external reference mode through the VCM pin.	External reference drives REFT and REFB
	1								1	X	X						PHASE_DDR<1:0>	Controls the phase of LCLK output relative to data.	90 degrees
45														0	X		PAT_DESKEW	Enables deskew pattern mode.	Inactive
														X	0		PAT_SYNC	Enables sync pattern mode.	Inactive
46	1						1							X			BTC_MODE	Binary twos complement format for ADC output.	Straight offset binary
	1						1						X				MSB_FIRST	Serialized ADC output comes out MSB-first.	LSB-first output
	1						1					X					EN_SDR	Enables SDR output mode (LCLK becomes a 12x input clock).	DDR output mode
	1		1				1					1					FALL_SDR	Controls whether the LCLK rising or falling edge comes in the middle of the data window when operating in SDR output mode.	Rising edge of LCLK in middle of data window

## SUMMARY OF FEATURES

FEATURES	DEFAULT	SELECTION	POWER IMPACT (Relative to Default) AT $f_s = 50\text{MSPS}$
<b>ANALOG FEATURES</b>			
Internal or external reference (driven on the REFT and REFB pins)	N/A	Pin	Internal reference mode takes approximately 20mW more power on AVDD1
External reference driven on the CM pin	Off	Register 42	Approximately 8mW less power on AVDD1
Duty cycle correction circuit	Off	Register 42	Approximately 7mW more power on AVDD1
Low-frequency noise suppression	Off	Register 14	With zero input to the ADC, low-frequency noise suppression causes digital switching at $f_s/2$ , thereby increasing LVDD power by approximately 5.5mW/channel
Single-ended or differential clock	Single-ended	Register 42	Differential clock mode takes approximately 7mW more power on AVDD1
Power-down mode	Off	Pin and register 0F	Refer to the <i>Power-Down Modes</i> section in the <a href="#">Electrical Characteristics</a> table
<b>DIGITAL FEATURES</b>			
Programmable digital gain (0dB to 12dB)	0dB	Registers 2A and 2B	No difference
Straight offset or BTC output	Straight offset	Register 46	No difference
Swap polarity of analog input pins	Off	Register 24	No difference
<b>LVDS OUTPUT PHYSICAL LAYER</b>			
LVDS internal termination	Off	Register 12	Approximately 7mW more power on AVDD
LVDS current programmability	3.5mA	Register 11	As per LVDS clock and data buffer current setting
<b>LVDS OUTPUT TIMING</b>			
LSB- or MSB-first output	LSB-first	Register 46	No difference
DDR or SDR output	DDR	Register 46	SDR mode takes approximately 2mW more power on LVDD (at $f_s = 30\text{MSPS}$ )
LCLK phase relative to data output	Refer to <a href="#">Figure 94</a>	Register 42	No difference

## DESCRIPTION OF SERIAL REGISTERS

### SOFTWARE RESET

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
00																X	S_RST

Software reset is applied when the RST bit is set to '1'; setting this bit resets all internal registers and self-clears to '0'.

**Table 4. VCA Register Information**

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
03	0	0	0	0		0	0	0	0	0	RES_V CA	0	0	0	0	0
16	VCA D15	VCA D14	VCA D13	VCA D12	VCA D11	VCA D10	VCA D9	VCA D8	VCA D7	VCA D6	VCA D5	VCA D4	VCA D3	VCA D2	1 <sup>(1)</sup> D1	1 <sup>(1)</sup> D0
17	VCA D31	VCA D30	VCA D29	VCA D28	VCA D27	VCA D26	VCA D25	VCA D24	VCA D23	VCA D22	VCA D21	VCA D20	VCA D19	VCA D18	VCA D17	VCA D16
18									VCA D39	VCA D38	VCA D37	VCA D36	VCA D35	VCA D34	VCA D33	VCA D32

(1) Bits D0 and D1 of register 16 are forced to '1'.

- VCA\_SCLK and VCA\_SDATA become active only when one of the registers 16, 17 or 18 (address in hex) of the AFE5804 are written into.
- The contents of all three registers (total 40 bits) are written on VCA\_SDATA even if only one of the above registers is written to. This condition is only valid if the content of the register has changed because of the most recent write. Writing contents that are the same as existing contents does not trigger activity on VCA\_SDATA.
- For example, if register 17 is written to after a RESET is applied, then the contents of register 17 as well as the default values of the bits in registers 16 and 18 are written to VCA\_SDATA.
- If register 16 is then written to, then the new contents of register 16, the previously written contents of register 17, and the default contents of register 18 are written to VCA\_SDATA. Note that regardless of what is written to D0 and D1 of register 16, the respective outputs on VCA\_SDATA are always '1'.
- Alternatively, all three registers (16, 17 and 18) can also be written within one write cycle of the ADC serial interface. In that case, there would be 48 consecutive SCLK edges within the same CS active window.
- VCA\_SCLK is generated using an oscillator (running at approximately 6MHz) inside the AFE5804, but the oscillator is gated so that it is active only during the write operation of the 40 VCA bits.
- The external ADC SCLK frequency can be greater than 6MHz. To ensure the SDATA transfer reliability,  $\geq 1\mu\text{s}$  gap is recommended between programming two VCA registers consecutively.

### VCA Reset

- VCA\_CS should be permanently connected to the RST-input.
- When VCA\_CS goes high (either because of an active low pulse on ADS\_RESET for more than 10ns or as a result of setting bit RES\_VCA), the following functions are performed inside the AFE5804:
  - Bits D0 and D1 of register 16 are forced to '1'
  - All other bits in registers 16, 17 and 18 are RESET to the respective default values ('0' for all bits except D5 of register 16 which is set to a default of '1').
  - No activity on signals VCA\_SCLK and VCA\_SDATA.
- If bit RES\_VCA has been set to '1', then the state machine is in the RESET state until RES\_VCA is set to '0'.

**INPUT REGISTER BIT MAPS**
**Table 5. VCA Register Map**

BYTE 1	BYTE 2		BYTE 3		BYTE 4		BYTE 5	
D0:D7	D8:D11	D12:D15	D16:D19	D20:D23	D24:D27	D28:D31	D32:D35	D36:D39

## POWER-DOWN MODES

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME	
0F													X	X	X	X	PDN_CH<1:4>	
									X	X	X	X					PDN_CH<8:5>	
								X									PDN_PARTIAL	
							0	X										PDN_COMPLETE
							X	0										PDN_PIN_CFG

Each of the eight ADC channels can be individually powered down. PDN\_CH<N> controls the power-down mode for the ADC channel <N>.

In addition to channel-specific power-down, the AFE5804 also has two global power-down modes: partial power-down mode and complete power-down mode.

In addition to programming the device for either of these two power-down modes (through either the PDN\_PARTIAL or PDN\_COMPLETE bits, respectively), the ADS\_PD pin itself can be configured as either a partial power-down pin or a complete power-down pin control. For example, if PDN\_PIN\_CFG = 0 (default), when the ADS\_PD pin is high, the device enters complete power-down mode. However, if PDN\_PIN\_CFG = 1, when the ADS\_PD pin is high, the device enters partial power-down mode.

The partial power-down mode function allows the AFE5804 to be rapidly placed in a low-power state. In this mode, most amplifiers in the signal path are powered down, while the internal references remain active. This configuration ensures that the external bypass capacitors retain the respective charges, minimizing the wake-up response time. The wake-up response is typically less than 50µs, provided that the clock has been running for at least 50µs before normal operating mode resumes. The power-down time is instantaneous (less than 1.0µs).

In partial power-down mode, the part typically dissipates only 95mW, representing a 76% power reduction compared to the normal operating mode. This function is controlled through the ADS\_PD and VCA\_PD pins, which are designed to interface with 3.3V low-voltage logic. If separate control of the two PD pins is not desired, then both can be tied together. In this case, the ADS\_PD pin should be configured to operate as a partial power-down mode pin (see [further information](#) below).

For normal operation the PD pins should be tied to a logic low (0); a high (1) places the AFE5804 into partial power-down mode.

To achieve the lowest power dissipation of only 52mW, the AFE5804 can be placed in complete power-down mode. This mode is controlled through the serial interface by setting Register 16 (bit D2) and Register 0F (bit D9:D10). In complete power-down mode, all circuits (including references) within the AFE5804 are powered-down, and the bypass capacitors then discharge. Consequently, the wake-up time from complete power-down mode depends largely on the time needed to recharge the bypass capacitors. Another factor that affects the wake-up time is the elapsed time that the AFE5804 spends in shutdown mode.

## LVDS DRIVE PROGRAMMABILITY

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
11														X	X	X	ILVDS_LCLK<2:0>
										X	X	X					ILVDS_FRAME<2:0>
						X	X	X									ILVDS_DAT<2:0>

The LVDS drive strength of the bit clock (LCLKP or LCLKM) and the frame clock (FCLKP or FCLKM) can be individually programmed. The LVDS drive strengths of all the data outputs OUTP and OUTM can also be programmed to the same value.

All three drive strengths (bit clock, frame clock, and data) are programmed using sets of three bits. [Table 15](#) shows an example of how the drive strength of the bit clock is programmed (the method is similar for the frame clock and data drive strengths).

**Table 15. Bit Clock Drive Strength<sup>(1)</sup>**

ILVDS_LCLK<2>	ILVDS_LCLK<1>	ILVDS_LCLK<0>	LVDS DRIVE STRENGTH FOR LCLKP AND LCLKM
0	0	0	3.5mA (default)
0	0	1	2.5mA
0	1	0	1.5mA
0	1	1	0.5mA
1	0	0	7.5mA
1	0	1	6.5mA
1	1	0	5.5mA
1	1	1	4.5mA

(1) Current settings lower than 1.5mA are not recommended.

## LVDS INTERNAL TERMINATION PROGRAMMING

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
12		X															EN_LVDS_TERM
		1												X	X	X	TERM_LCLK<2:0>
		1								X	X	X					TERM_FRAME<2:0>
		1				X	X	X									TERM_DAT<2:0>

The LVDS buffers have high-impedance current sources that drive the outputs. When driving traces with characteristic impedances that are not perfectly matched with the termination impedance on the receiver side, there may be reflections back to the LVDS output pins of the AFE5804 that cause degraded signal integrity. By enabling an internal termination (between the positive and negative outputs) for the LVDS buffers, the signal integrity can be significantly improved in such scenarios. To set the internal termination mode, the EN\_LVDS\_TERM bit should be set to '1'. Once this bit is set, the internal termination values for the bit clock, frame clock, and data buffers can be independently programmed using sets of three bits. Table 16 shows an example of how the internal termination of the LVDS buffer driving the bit clock is programmed (the method is similar for the frame clock and data drive strengths). These termination values are only typical values and can vary by several percentages across temperature and from device to device.

**Table 16. Bit Clock Internal Termination**

TERM_LCLK<2>	TERM_LCLK<1>	TERM_LCLK<0>	INTERNAL TERMINATION BETWEEN LCLKP AND LCLKM ( $\Omega$ )
0	0	0	None
0	0	1	260
0	1	0	150
0	1	1	94
1	0	0	125
1	0	1	80
1	1	0	66
1	1	1	55

## LOW-FREQUENCY NOISE SUPPRESSION MODE

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
14													X	X	X	X	LFNS_CH<1:4>
									X	X	X	X					LFNS_CH<8:5>

The low-frequency noise suppression mode is especially useful in applications where good noise performance is desired in the frequency band of 0MHz to 1MHz (around dc). Setting this mode shifts the low-frequency noise of the AFE5804 to approximately  $f_s/2$ , thereby moving the noise floor around dc to a much lower value. LFNS\_CH<8:1> enables this mode individually for each channel.

## LVDS TEST PATTERNS

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
25										X	0	0					EN_RAMP
										0	X	0					DUALCUSTOM_PAT
										0	0	X					SINGLE_CUSTOM_PAT
															X	X	BITS_CUSTOM1<11:10>
													X	X			BITS_CUSTOM2<11:10>
26	X	X	X	X	X	X	X	X	X	X							BITS_CUSTOM1<9:0>
27	X	X	X	X	X	X	X	X	X	X							BITS_CUSTOM2<9:0>
45															0	X	PAT_DESKEW
														X	0		PAT_SYNC

The AFE5804 can output a variety of test patterns on the LVDS outputs. These test patterns replace the normal ADC data output. Setting EN\_RAMP to '1' causes all the channels to output a repeating full-scale ramp pattern. The ramp increments from zero code to full-scale code in steps of 1LSB every clock cycle. After hitting the full-scale code, it returns back to zero code and ramps again.

The device can also be programmed to output a constant code by setting SINGLE\_CUSTOM\_PAT to '1', and programming the desired code in BITS\_CUSTOM1<11:0>. In this mode, BITS\_CUSTOM<11:0> take the place of the 12-bit ADC data at the output, and are controlled by LSB-first and MSB-first modes in the same way as normal ADC data are.

The device may also be made to toggle between two consecutive codes by programming DUAL\_CUSTOM\_PAT to '1'. The two codes are represented by the contents of BITS\_CUSTOM1<11:0> and BITS\_CUSTOM2<11:0>.

In addition to custom patterns, the device may also be made to output two preset patterns:

1. **Deskew patten:** Set using PAT\_DESKEW, this mode replaces the 12-bit ADC output D<11:0> with the *010101010101* word.
2. **Sync pattern:** Set using PAT\_SYNC, the normal ADC word is replaced by a fixed *111111000000* word.

Note that only one of the above patterns should be active at any given instant.

## PROGRAMMABLE GAIN

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
2A									X	X	X	X	X	X	X	X	GAIN_CH4<3:0>
																	GAIN_CH3<3:0>
					X	X	X	X									GAIN_CH2<3:0>
	X	X	X	X													GAIN_CH1<3:0>
2B	X	X	X	X													GAIN_CH5<3:0>
					X	X	X	X									GAIN_CH6<3:0>
									X	X	X	X					GAIN_CH7<3:0>
													X	X	X	X	GAIN_CH8<3:0>

The AFE5804, through its registers, allows for a digital gain to be programmed for each channel. This programmable gain can be set to achieve the full-scale output code even with a lower analog input swing. The programmable gain not only fills the output code range of the ADC, but also enhances the SNR of the device by using quantization information from some extra internal bits. The programmable gain for each channel can be individually set using a set of four bits, indicated as GAIN\_CHN<3:0> for Channel N. The gain setting is coded in binary from 0dB to 12dB, as shown in [Table 17](#).

**Table 17. Gain Setting for Channel 1**

GAIN_CH1<3>	GAIN_CH1<2>	GAIN_CH1<1>	GAIN_CH1<0>	CHANNEL 1 GAIN SETTING
0	0	0	0	0dB
0	0	0	1	1dB
0	0	1	0	2dB
0	0	1	1	3dB
0	1	0	0	4dB
0	1	0	1	5dB
0	1	1	0	6dB
0	1	1	1	7dB
1	0	0	0	8dB
1	0	0	1	9dB
1	0	1	0	10dB
1	0	1	1	11dB
1	1	0	0	12dB
1	1	0	1	Do not use
1	1	1	0	Do not use
1	1	1	1	Do not use

## CLOCK, REFERENCE, AND DATA OUTPUT MODES

ADDRESS IN HEX	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	NAME
42	1								1							X	DIFF_CLK
	1								1					X			EN_DCC
	1								1				X				EXT_REF_VCM
	1								1	X	X						PHASE_DDR<1:0>
46	1						1							X			BTC_MODE
	1						1						X				MSB_FIRST
	1						1					X					EN_SDR
	1		1				1					1					FALL_SDR

### INPUT CLOCK

The AFE5804 is configured by default to operate with a single-ended input clock; CLKP is driven by a CMOS clock and CLKM is tied to '0'. However, by programming DIFF\_CLK to '1', the device can be made to work with a differential input clock on CLKP and CLKM. Operating with a low-jitter differential clock generally provides better SNR performance, especially at input frequencies greater than 30MHz.

In cases where the duty cycle of the input clock falls outside the 45% to 55% range, it is recommended to enable an internal duty cycle correction circuit. Enable this circuit by setting the EN\_DCC bit to '1'.

### EXTERNAL REFERENCE

The AFE5804 can be made to operate in external reference mode by pulling the INT/ $\overline{\text{EXT}}$  pin to '0'. In this mode, the REFT and REFB pins should be driven with voltage levels of 2.5V and 0.5V, respectively, and must have enough drive strength to drive the switched capacitance loading of the reference voltages by each ADC. The advantage of using the external reference mode is that multiple AFE5804 units can be made to operate with the same external reference, thereby improving parameters such as gain matching across devices. However, in applications that do not have an available high drive, differential external reference, the AFE5804 can still be driven with a single external reference voltage on the CM pin. When EXT\_REF\_VCM is set as '1' (and the INT/ $\overline{\text{EXT}}$  pin is set to '0'), the CM pin is configured as an input pin, and the voltages on REFT and REFB are generated as shown in [Equation 1](#) and [Equation 2](#).

$$V_{\text{REFT}} = 1.5\text{V} + \frac{V_{\text{CM}}}{1.5\text{V}} \quad (1)$$

$$V_{\text{REFB}} = 1.5\text{V} - \frac{V_{\text{CM}}}{1.5\text{V}} \quad (2)$$

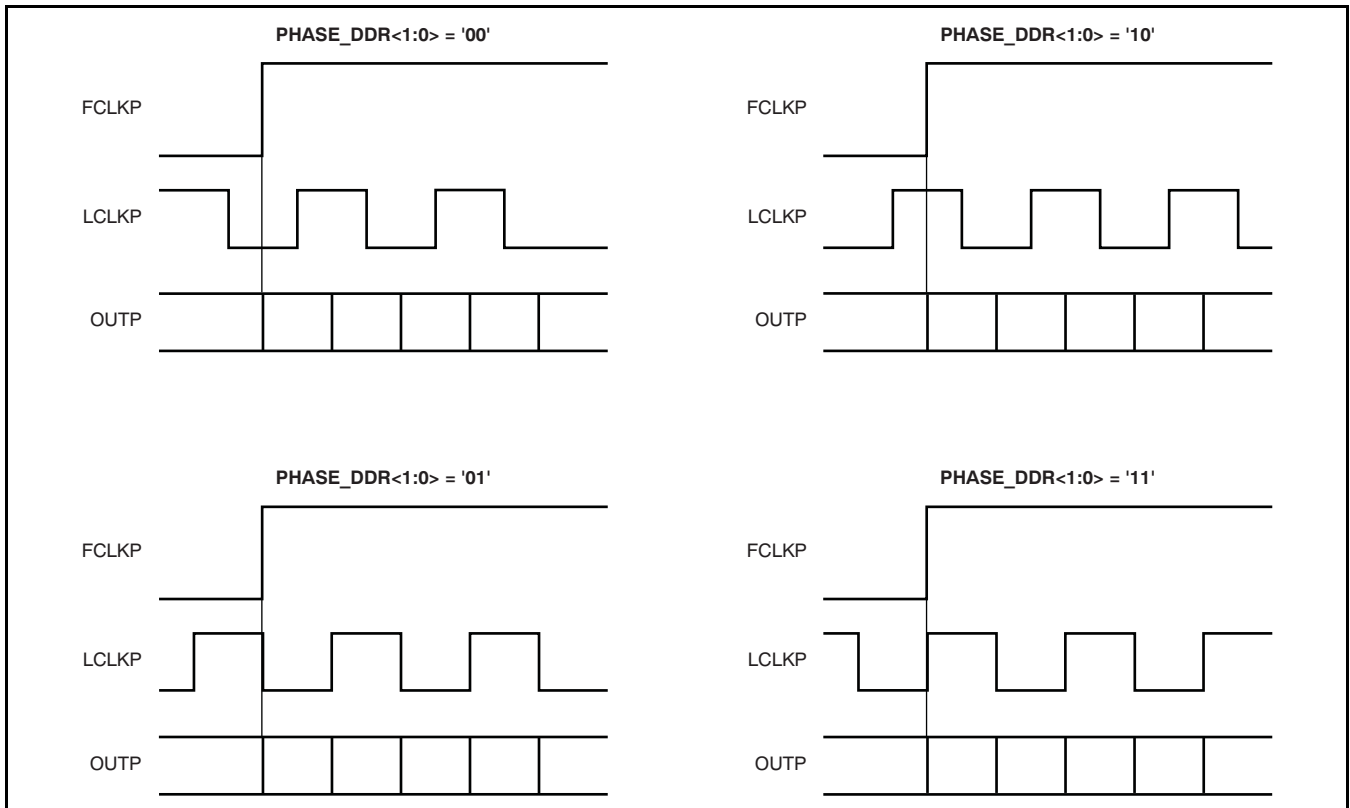

**BIT CLOCK PROGRAMMABILITY**

The output interface of the AFE5804 is normally a DDR interface, with the LCLK rising edge and falling edge transitions in the middle of alternate data windows. [Figure 94](#) shows this default phase.

**Figure 94. LCLK Default Phase**

The phase of LCLK can be programmed relative to the output frame clock and data using bits PHASE\_DDR<1:0>. [Figure 95](#) shows the LCLK phase modes.

**Figure 95. LCLK Phase Programmability Modes**

In addition to programming the phase of LCLK in the DDR mode, the device can also be made to operate in SDR mode by setting the EN\_SDR bit to '1'. In this mode, the bit clock (LCLK) is output at 12 times the input clock, or twice the rate as in DDR mode. Depending on the state of FALL\_SDR, LCLK may be output in either of the two manners shown in Figure 96. As Figure 96 illustrates, only the LCLK rising (or falling) edge is used to capture the output data in SDR mode.

**Figure 96. SDR Interface Modes**

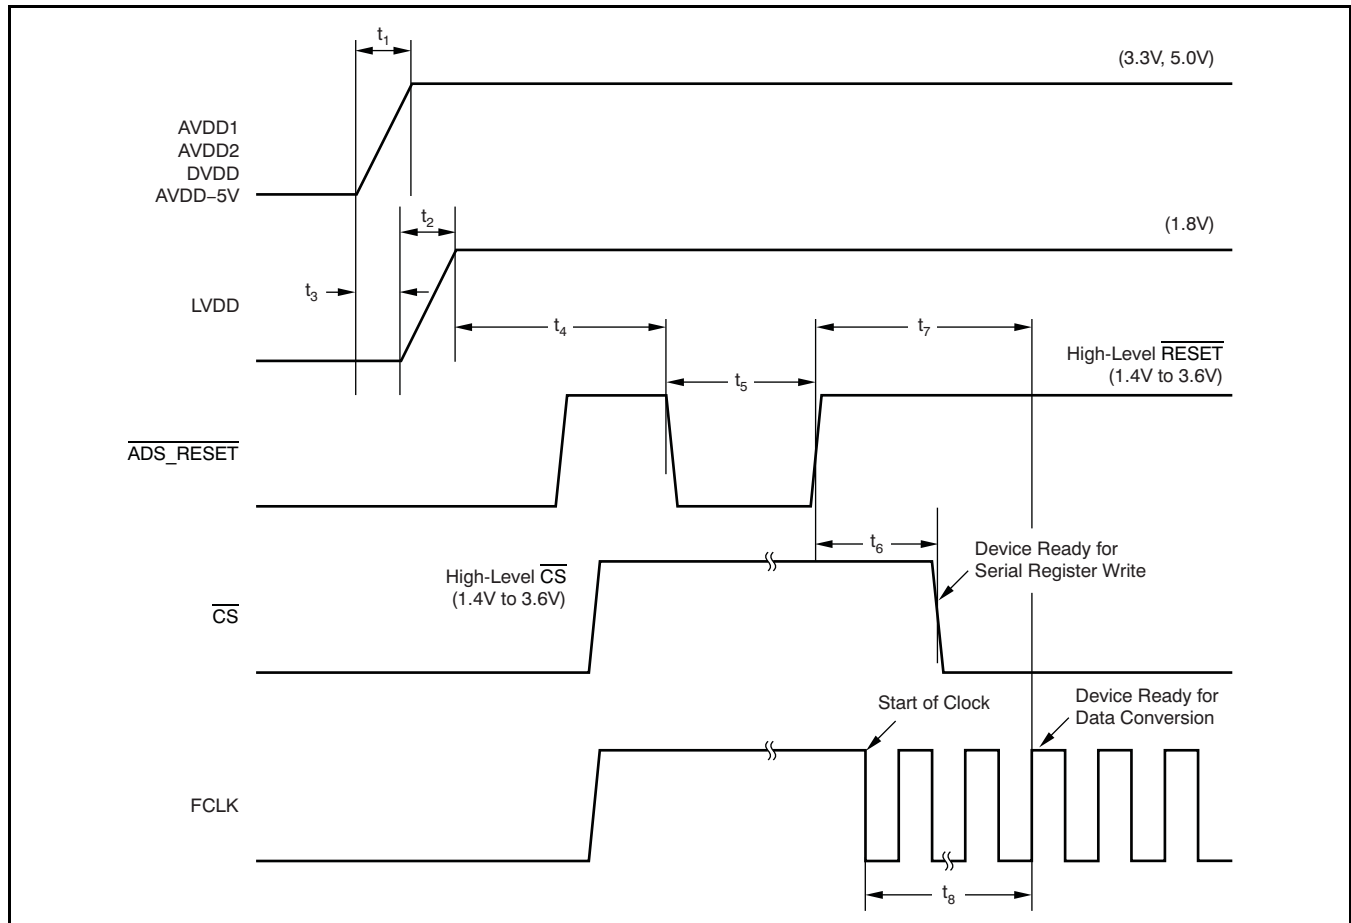

The SDR mode does not work well beyond 40MSPS because the LCLK frequency becomes very high.

#### DATA OUTPUT FORMAT MODES

The ADC output, by default, is in straight offset binary mode. Programming the BTC\_MODE bit to '1' inverts the MSB, and the output becomes binary two's complement mode.

Also by default, the first bit of the frame (following the rising edge of FCLKP) is the LSB of the ADC output. Programming the MSB\_FIRST mode inverts the bit order in the word, and the MSB is output as the first bit following the FCLKP rising edge.

### RECOMMENDED POWER-UP SEQUENCING AND RESET TIMING

$10\mu\text{s} < t_1 < 50\text{ms}$ ,  $10\mu\text{s} < t_2 < 50\text{ms}$ ,  $-10\text{ms} < t_3 < 10\text{ms}$ ,  $t_4 > 10\text{ms}$ ,  $t_5 > 100\text{ns}$ ,  $t_6 > 100\text{ns}$ ,  $t_7 > 10\text{ms}$ , and  $t_8 > 100\mu\text{s}$ .

(1) The AVDDx and LVDD power-on sequence does not matter as long as  $-10\text{ms} < t_3 < 10\text{ms}$ . Similar considerations apply while shutting down the device.

### POWER-DOWN TIMING

Power-up time shown is based on  $1\mu\text{F}$  bypass capacitors on the reference pins.  $t_{\text{WAKE}}$  is the time it takes for the device to wake up completely from power-down mode. The AFE5804 has two power-down modes: complete power-down mode and partial power-down mode.

(2)  $t_{\text{WAKE}} \leq 50\mu\text{s}$  for complete power-down mode.  $t_{\text{WAKE}} \leq 2\mu\text{s}$  for partial power-down mode (provided the clock is not shut off during power-down).

(3) The ADS\_PD pins can be configured for partial power-down mode through a register setting.

## THEORY OF OPERATION

The AFE5804 is an eight-channel, fully integrated analog front-end device. Its integrated LNA, attenuator, PGA, LPF, and ADC implement a number of proprietary circuit design techniques to specifically address the performance demands of medical ultrasound systems. It offers unparalleled low-noise and low-power performance at a high level of integration. For the TGC signal path, each channel consists of a 20dB fixed-gain low-noise amplifier (LNA), a linear-in-dB voltage-controlled attenuator (VCA), and a programmable gain amplifier (PGA), as well as a clamping and low-pass filter stage. Digitally-controlled through the logic interface, the PGA gain can be set to four different settings: 20dB, 25dB, 27dB, and 30dB. At its highest setting, the total available gain of the AFE5804 is therefore 50dB. To facilitate the logarithmic time-gain compensation required for ultrasound systems, the VCA is designed to provide a 46dB attenuation range. Here, all channels are simultaneously controlled by an externally-applied control voltage ( $V_{CNTL}$ ) in the range

of 0V to 1.2V. While the LNA is designed to be driven from a single-ended source, the internal TGC signal path is designed to be fully differential to maximize dynamic range while also optimizing for low, even-order harmonic distortion.

CW doppler signal processing is facilitated by routing the differential LNA outputs to V/I amplifier stages. The resulting signal currents of each channel then connect to an  $8 \times 10$  switch matrix that is controlled through the serial interface and a corresponding register. The CW outputs are typically routed to a passive delay line that allows coherent summing (beam forming) of the active channels and additional off-chip signal processing, as shown in [Figure 97](#).

Applications that do not utilize the CW path can simply operate the AFE5804 in TGC mode. In this mode, the CW blocks (V/I amplifiers and switch matrix) remain powered down, and the CW outputs can be left unconnected.

**Figure 97. Functional Block Diagram**

## LOW-NOISE AMPLIFIER (LNA)

As with many high-gain systems, the front-end amplifier is critical to achieve a certain overall performance level. Using a proprietary new architecture, the LNA of the AFE5804 delivers exceptional low-noise performance, while operating on a very low quiescent current compared to CMOS-based architectures with similar noise performances.

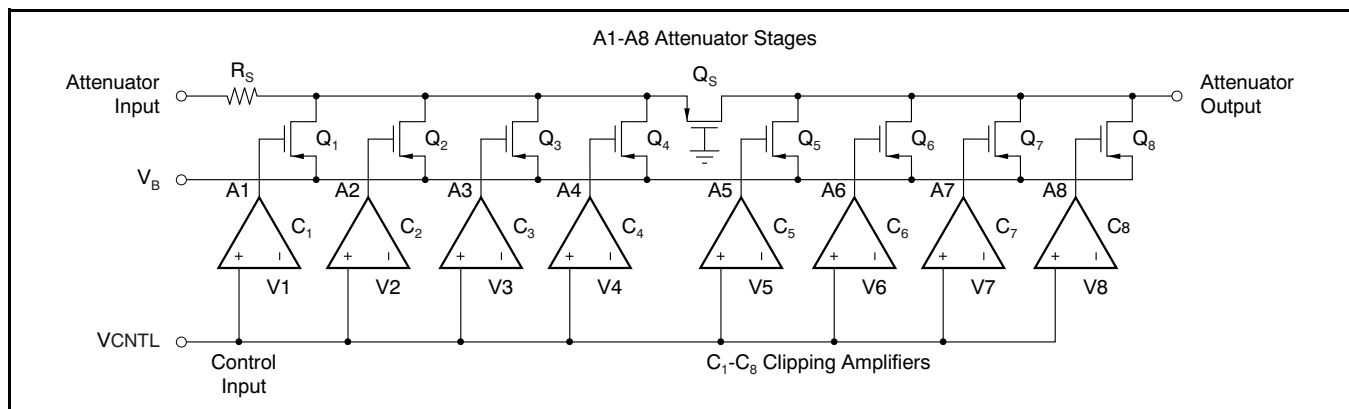

The LNA performs a single-ended input to differential output voltage conversion and is configured for a fixed gain of 20dB (10V/V). The ultralow input-referred noise of only  $0.75\text{nV}/\sqrt{\text{Hz}}$ , along with the linear input range of  $280\text{mV}_{\text{PP}}$ , results in a wide dynamic range that supports the high demands of PW and CW ultrasound imaging modes. Larger input signals can be accepted by the LNA, but distortion performance degrades as input signals levels increase. The LNA input is internally biased to approximately 2.4V; the signal source should be ac-coupled to the LNA input by an adequately-sized capacitor. Internally, the LNA directly drives the VCA, avoiding the typical drawbacks of ac-coupled architectures, such as slow overload recovery.

## VOLTAGE-CONTROLLED ATTENUATOR (VCA)

The VCA is designed to have a linear-in-dB attenuation characteristic; that is, the average gain loss in dB is constant for each equal increment of the control voltage (VCNTL). [Figure 98](#) shows the simplified schematic of this VCA stage.

The attenuator is essentially a variable voltage divider that consists of the series input resistor ( $R_S$ ) and eight identical shunt FETs placed in parallel and controlled by sequentially activated clipping amplifiers (A1 through A8). Each clipping amplifier can be understood as a specialized voltage comparator with a soft transfer characteristic and well-controlled output limit voltage. Reference voltages V1 through V8 are equally spaced over the 0V to 1.2V control voltage range. As the control voltage rises through the input range of each clipping amplifier, the amplifier output rises from 0V (FET completely ON) to  $V_{\text{CM}} - V_{\text{T}}$  (FET nearly OFF), where  $V_{\text{CM}}$  is the common source voltage and  $V_{\text{T}}$  is the threshold voltage of the FET. As each FET approaches its off state and the control voltage continues to rise, the next clipping amplifier/FET combination takes over for the next portion of the piecewise-linear attenuation characteristic.

Thus, low control voltages have most of the FETs turned on, producing maximum signal attenuation. Similarly, high control voltages turn the FETs off, leading to minimal signal attenuation. Therefore, each FET acts to decrease the shunt resistance of the voltage divider formed by  $R_S$  and the parallel FET network.

**Figure 98. Voltage-Controlled Attenuator Simplified Schematic**

## PROGRAMMABLE POST-GAIN AMPLIFIER (PGA)

Following the VCA is a programmable post-gain amplifier (PGA). Figure 99 shows a simplified schematic of the PGA, including the clamping stage. The gain of this PGA can be configured to four different gain settings: 20dB, 25dB, 27dB, and 30dB, programmable through the serial port; see Table 11.

The PGA structure consists of a differential, programmable-gain voltage-to-current converter stage followed by transimpedance amplifiers to buffer each side of the differential output. Low input noise is also a requirement for the PGA design as a result of the large amount of signal attenuation that can be applied in the preceding VCA stage. At minimum VCA attenuation (used for small input signals), the LNA noise dominates; at maximum VCA attenuation (large input signals), the attenuator and PGA noise dominates.

Figure 99. Post-Gain Amplifier (Simplified Schematic)

## CLAMPING

To further optimize the overload recovery behavior of a complete TGC channel, the AFE5804 integrates a clamping stage, as shown in Figure 100. This clamping stage precedes the low-pass filter in order to prevent the filter circuit from being driven into overload, the result of which would be an extended recovery time. The clamping level is fixed to clamp the signal level to approximately  $2.3V_{PP}$  differential.

## LOW-PASS FILTER

The AFE5804 integrates an anti-aliasing filter in the form of a programmable low-pass filter (LPF) for each channel. The LPF is designed as a differential, active, second-order filter that approximates a Bessel characteristic, with typically 12dB per octave roll-off. Figure 100 shows the simplified schematic of half the differential active low-pass filter. Programmable through the serial interface, the  $-3dB$  frequency corner can be set to either 12.5MHz or 17MHz. The filter bandwidth is set for all channels simultaneously.

Figure 100. Clamping Stage and Low-Pass Filter (Simplified Schematic)

## ANALOG-TO-DIGITAL CONVERSION

The analog-to-digital converter (ADC) of the AFE5804 employs a pipelined converter architecture that consists of a combination of multi-bit and single-bit internal stages. Each stage feeds its data into the digital error correction logic, ensuring excellent differential linearity and no missing codes at the 12-bit level.

The 12 bits given out by each channel are serialized and sent out on a single pair of pins in LVDS format. All eight channels of the AFE5804 operate from a common input clock (CLKP/M). The sampling clocks for each of the eight channels are generated from the input clock using a carefully matched clock buffer tree. The 12x clock required for the serializer is generated internally from CLKP/M using a phase-locked loop (PLL). A 6x and a 1x clock are also output in LVDS format, along with the data, to enable easy data capture. The AFE5804 operates from internally-generated reference voltages that are trimmed to improve the gain matching across devices, and provide the option to operate the

devices without having to externally drive and route reference lines. The nominal values of REFT and REFB are 2.5V and 0.5V, respectively. The references are internally scaled down differentially by a factor of 2.  $V_{CM}$  (the common-mode voltage of REFT and REFB) is also made available externally through a pin, and is nominally 1.5V.

The ADC output goes to a serializer that operates from a 12x clock generated by the PLL. The 12 data bits from each channel are serialized and sent LSB first. In addition to serializing the data, the serializer also generates a 1x clock and a 6x clock. These clocks are generated in the same way the serialized data are generated, so these clocks maintain perfect synchronization with the data. The data and clock outputs of the serializer are buffered externally using LVDS buffers. Using LVDS buffers to transmit data externally has multiple advantages, such as a reduced number of output pins (saving routing space on the board), reduced power consumption, and reduced effects of digital noise coupling to the analog circuit inside the AFE5804.

## APPLICATION INFORMATION

### ANALOG INPUT AND LNA

While the LNA is designed as a fully differential amplifier, it is optimized to perform a single-ended input to differential output conversion. A simplified schematic of an LNA channel is shown in Figure 101. A bias voltage ( $V_B$ ) of +2.4V is internally applied to the LNA inputs through 8k $\Omega$  resistors. In addition, the dedicated signal input (IN pin) includes a pair of back-to-back diodes that provide a coarse input clamping function in case the input signal rises to very large levels, exceeding 0.6V<sub>PP</sub>. This configuration prevents the LNA from being driven into a severe overload state, which may otherwise cause an extended overload recovery time. The integrated diodes are designed to handle a dc current of up to approximately 5mA. Depending on the application requirements, the system overload characteristics may be improved by adding external Schottky diodes at the LNA input, as shown in Figure 101.

As Figure 101 also shows, the complementary LNA input ( $V_{BL}$  pin) is internally decoupled by a small capacitor. Furthermore, for each input channel, a separate  $V_{BL}$  pin is brought out for external bypassing. This bypassing should be done with a small, 0.1 $\mu$ F (typical) ceramic capacitor placed in close proximity to each  $V_{BL}$  pin. Attention should be given to provide a low-noise analog ground for this bypass capacitor. A noisy ground potential may cause noise to be picked up and injected into the signal path, leading to higher noise levels.

The LNA closed-loop architecture is internally compensated for maximum stability without the need for external compensation components (inductors or capacitors). At the same time, the total input capacitance is kept to a minimum with only 16pF. This architecture minimizes any loading of the signal source that may otherwise lead to a frequency-dependent voltage divider. Moreover, the closed-loop design yields very low offsets and offset drift; this consideration is important because the LNA directly drives the subsequent voltage-controlled attenuator.

The LNA of the AFE5804 uses the benefits of a bipolar process technology to achieve an exceptionally low noise voltage of 0.75nV/ $\sqrt{\text{Hz}}$ , and a low current noise of only 3pA/ $\sqrt{\text{Hz}}$  (in TGC mode 1). With these input-referred noise specifications, the AFE5804 achieves very low noise figure numbers over a wide range of source resistances and frequencies (see the graph, *Noise Figure vs Frequency Over  $R_S$*  in the Typical Characteristics). The optimal noise power matching is achieved for source impedances of around 200 $\Omega$ . Further details of the AFE5804 input noise performance are shown in the Typical Characteristic graphs.

**Table 18. Noise Figure versus Source Resistance ( $R_S$ ) at 2MHz**

$R_S$ ( $\Omega$ )	NOISE FIGURE (dB)
50	2.1
200	1.1
400	1.2
1000	1.9

**Figure 101. LNA Channel (Simplified Schematic)**

## OVERLOAD RECOVERY

The AFE5804 is designed in particular for ultrasound applications where the front-end device is required to recover very quickly from an overload condition. Such an overload can either be the result of a transmit pulse feedthrough or a strong echo, which can cause overload of the LNA, PGA, and ADC. As discussed earlier, the LNA inputs are internally protected by a pair of back-to-back diodes to prevent severe overload of the LNA. [Figure 102](#) illustrates an ultrasound receive channel front-end that includes typical external overload protection elements. Here, four high-voltage switching diodes are configured in a bridge configuration and form the transmit/receive (T/R) switch. During the transmit period, high voltage pulses from the pulser are applied to the transducer elements and the T/R switch isolates the sensitive LNA input from being damaged by the high voltage signal. However, it is common that fast transients up to several volts leak through the T/R switch and potentially overload the receiver. Therefore, an additional pair of clamping diodes is placed between the T/R switch and the LNA input. In order to clamp the over-voltage to small levels, Schottky diodes (such as the BAS40 series by Infineon®) are commonly used. For example, clamping to levels of

$\pm 0.3\text{V}$  can significantly reduce the overall overload recovery performance. The T/R switch characteristics are largely determined by the biasing current of the diodes, which can be set by adjusting the  $3\text{k}\Omega$  resistor values; for example, setting a higher current level may lead to an improved switching characteristic and reduced noise contribution. A typical front-end protection circuitry may add in the order of  $2\text{nV}/\sqrt{\text{Hz}}$  of noise to the signal path. The increase in noise also depends on the value of the termination resistor ( $R_T$ ).

As [Figure 102](#) shows, the front-end circuitry should be capacitively coupled to the LNA signal input (IN). This coupling ensures that the LNA input bias voltage of  $+2.4\text{V}$  is maintained and decoupled from any other biasing voltage before the LNA.

Within the AFE5804, overload can occur in either the LNA or the PGA. LNA overload can occur as the result of T/R switch feedthrough; and the PGA can be driven into an overload condition by a strong echo in the near-field while the signal gain is high. In any case, the AFE5804 is optimized for very short recovery times, as shown in [Figure 102](#).

**Figure 102. Typical Input Overload Protection Circuit of an Ultrasound System**

## VCA—GAIN CONTROL

The attenuator (VCA) for each of the eight channels of the AFE5804 is controlled by a single-ended control signal input, the  $V_{CNTL}$  pin. The control voltage range spans from 0V to 1.2V, referenced to ground. This control voltage varies the attenuation of the VCA based on its linear-in-dB characteristic with its maximum attenuation (minimum gain) at  $V_{CNTL} = 0V$ , and minimum attenuation (maximum gain) at  $V_{CNTL} = 1.2V$ . Table 19 shows the nominal gains for each of the four PGA gain settings. The total gain range is typically 46dB and remains constant independent of the PGA selected; the *Max Gain* column reflects the absolute gain of the full signal path comprised of the fixed LNA gain of 20dB and the programmable PGA gain.

**Table 19. Nominal Gain Control Ranges for Each of the Four PGA Gain Settings**

PGA GAIN	MIN GAIN AT $V_{CNTL} = 0V$	MAX GAIN AT $V_{CNTL} = 1.2V$
20dB	-5.5dB	40.5dB
25dB	-1.0dB	45.0dB
27dB	1.0dB	47.0dB
30dB	3.0dB	49.0dB

As previously discussed, the VCA architecture uses eight attenuator segments that are equally spaced in order to approximate the linear-in-dB gain-control slope. This approximation results in a monotonic slope; gain ripple is typically less than  $\pm 0.5dB$ .

The AFE5804 gain-control input has a -3dB bandwidth of approximately 1.5MHz. This wide bandwidth, although useful in many applications, can allow high-frequency noise to modulate the gain control input. In practice, this modulation can easily be avoided by additional external filtering ( $R_F$  and  $C_F$ ) of the control input, as Figure 103 shows. Stepping the control voltage from 0V to 1.2V, the gain control response time is typically less than 500ns to settle within 10% of the final signal level of a  $1V_{PP}$  (-6dBFS) output.

The control voltage input ( $V_{CNTL}$  pin) represents a high-impedance input. Multiple AFE5804 devices can be connected in parallel with no significant loading effects using the  $V_{CNTL}$  pin of each device. Note that when the  $V_{CNTL}$  pin is left unconnected, it floats up to a potential of about +3.7V. For any voltage level above 1.2V and up to 5.0V, the VCA continues to operate at its minimum attenuation level; however, it is recommended to limit the voltage to approximately 1.5V or less.

When the AFE5804 operates in CW mode, the attenuator stage remains connected to the LNA outputs. Therefore, it is recommended to set the  $V_{CNTL}$  voltage to +1.2V in order to minimize the internal loading of the LNA outputs. Small improvements in reduced power dissipation and improved distortion performance may also be realized.

**Figure 103. External Filtering of the  $V_{CNTL}$  Input**

## CW DOPPLER PROCESSING

The AFE5804 integrates many of the elements necessary to allow for the implementation of a CW doppler processing circuit, such as a V/I converter for each channel and a cross-point switch matrix with an 8-input into 10-output ( $8 \times 10$ ) configuration.

In order to switch the AFE5804 from the default TGC mode operation into CW mode, bit D5 of the control register must be updated to low ('0'). This setting also enables access to all other registers that determine the switch matrix configuration (see the [Input Register Bit Map](#) tables). In order to process CW signals, the LNA internally feeds into a differential V/I amplifier stage. The transconductance of the V/I amplifier is typically  $13.5mA/V$  with a  $100mV_{PP}$  input signal. For proper operation, the CW outputs must be connected to an external bias voltage of +2.5V. Each CW output is designed to sink a small dc current of 0.9mA, and can deliver a signal current up to  $2.9mA_{PP}$ .

The resulting signal current then passes through the 8×10 switch matrix. Depending on the programmed configuration of the switch matrix, any V/I amplifier current output can be connected to any of 10 CW outputs. This design is a simple current-summing circuit such that each CW output can represent the sum of any or all of the channel currents. The CW outputs are typically routed to a passive LC delay line, allowing coherent summing of the signals.

After summing, the CW signal path further consists of a high dynamic range mixer for down-conversion to I/Q base-band signals. The I/Q signals are then band-limited (that is, low-frequency contents are removed) in a filter stage that precedes a pair of high-resolution, low sample rate ADCs.

**Figure 104. Conceptual CW Doppler Signal Path Using Current Summing and a Passive Delay Line for Beam-Forming**

## CLOCK INPUT

The eight channels on the device operate from a single clock input. To ensure that the aperture delay and jitter are the same for all channels, the AFE5804 uses a clock tree network to generate individual sampling clocks to each channel. The clock paths for all the channels are matched from the source point to the sampling circuit. This architecture ensures that the performance and timing for all channels are identical. The use of the clock tree for matching introduces an aperture delay that is defined as the delay between the rising edge of FCLK and the actual instant of sampling. The aperture delays for all the channels are matched to the best possible extent. A mismatch of  $\pm 20\text{ps}$  ( $\pm 3\sigma$ ) could exist between the aperture instants of the eight ADCs within the same chip. However, the aperture delays of ADCs across two different chips can be several hundred picoseconds apart.

The AFE5804 can operate either in CMOS single-ended clock mode (default is  $\text{DIFF\_CLK} = 0$ ) or differential clock mode (SINE, LVPECL, or LVDS). In the single-ended clock mode, CLKM must be forced to  $0V_{\text{DC}}$ , and the single-ended CMOS applied on the CLKP pin. Figure 105 shows this operation.

**Figure 105. Single-Ended Clock Driving Circuit ( $\text{DIFF\_CLK} = 0$ )**

When configured for the differential clock mode (register bit  $\text{DIFF\_CLK} = 1$ ) the AFE5804 clock inputs can be driven differentially (SINE, LVPECL, or LVDS) with little or no difference in performance between them, or with a single-ended (LVCMOS). The common-mode voltage of the clock inputs is set to  $V_{\text{CM}}$  using internal  $5\text{k}\Omega$  resistors, as shown in Figure 106. This method allows using transformer-coupled drive circuits for a sine wave clock or ac-coupling for LVPECL and LVDS clock sources, as shown in Figure 107 and Figure 108. When operating in the differential clock mode, the single-ended CMOS clock can be ac-coupled to the CLKP input, with CLKM connected to ground with a  $0.1\mu\text{F}$  capacitor, as Figure 108 shows.

**Figure 106. Internal Clock Buffer**

**Figure 107. Differential Clock Driving Circuit ( $\text{DIFF\_CLK} = 1$ )**

**Figure 108. Single-Ended Clock Driving Circuit When  $\text{DIFF\_CLK} = 1$**

For best performance, the clock inputs must be driven differentially, reducing susceptibility to common-mode noise. For high input frequency sampling, it is recommended to use a clock source with very low jitter. Bandpass filtering of the clock source can help reduce the effect of jitter. If the duty cycle deviates from 50% by more than 2% or 3%, it is recommended to enable the DCC through register bit  $\text{EN\_DCC}$ .

## REFERENCE CIRCUIT

The digital beam-forming algorithm in an ultrasound system relies on gain matching across all receiver channels. A typical system has approximately 12 octal AFEs on the board. In such a case, it is critical to ensure that the gain is matched, essentially requiring the reference voltages seen by all the AFEs to be the same. Matching references within the eight channels of a chip is done by using a single internal reference voltage buffer. Trimming the reference voltages on each chip during production ensures that the reference voltages are well-matched across different chips.

All bias currents required for the internal operation of the device are set using an external resistor to ground at the ISET pin. Using a 56kΩ resistor on ISET generates an internal reference current of 20μA. This current is mirrored internally to generate the bias current for the internal blocks. Using a larger external resistor at ISET reduces the reference bias current and thereby scales down the device operating power. However, it is recommended that the external resistor be within 10% of the specified value of 56kΩ so that the internal bias margins for the various blocks are proper.

Buffering the internal bandgap voltage also generates the common-mode voltage  $V_{CM}$ , which is set to the midlevel of REFT and REFB. It is meant as a reference voltage to derive the input common-mode if the input is directly coupled. It can also be used to derive the reference common-mode voltage in the external reference mode. Figure 109 shows the suggested decoupling for the reference pins.

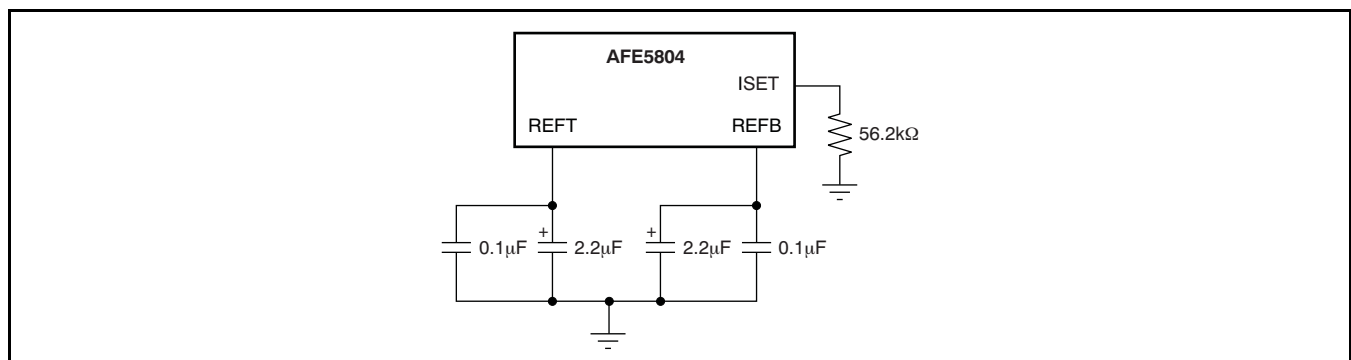

The device also supports the use of external reference voltages. There are two methods to force the references externally. The first method involves pulling INT/EXT low and forcing externally REFT and REFB to 2.5V and 0.5V nominally, respectively. In this mode, the internal reference buffer goes to a 3-state output. The external reference driving circuit should be designed to provide the required switching current for the eight ADCs inside the AFE5804. It should be noted that in this mode, CM and ISET continue to be generated from the internal bandgap voltage, as in the internal reference mode. It is therefore important to ensure that the common-mode voltage of the externally-forced reference voltages matches to within 50mV of  $V_{CM}$ .

The second method of forcing the reference voltages externally can be accessed by pulling INT/EXT low, and programming the serial interface to drive the external reference mode through the CM pin (register bit called EXT\_REF\_VCM). In this mode, CM becomes configured as an input pin that can be driven from external circuitry. The internal reference buffers driving REFT and REFB are active in this mode. Forcing 1.5V on the CM pin in the mode results in REFT and REFB coming to 2.5V and 0.5V, respectively. In general, the voltages on REFT and REFB in this mode are given by Equation 3 and Equation 4:

$$V_{REFT} = 1.5V + \frac{V_{CM}}{1.5V} \quad (3)$$

$$V_{REFB} = 1.5V - \frac{V_{CM}}{1.5V} \quad (4)$$

The state of the reference voltage internal buffers during various combinations of the PD, INT/EXT, and EXT\_REF\_VCM register bits is described in Table 20.

**Figure 109. Suggested Decoupling on the Reference Pins**

**Table 20. State of Reference Voltages for Various Combinations of PD and INT/EXT**

REGISTER BIT	INTERNAL BUFFER STATE							
	0	0	1	1	0	0	1	1
PD	0	0	1	1	0	0	1	1
INT/EXT	0	1	0	1	0	1	0	1

CM pin	1.5V	1.5V	1.5V	1.5V	Force	Do not use	Force	Do not use

(1) Weakly forced with reduced strength.

## POWER SUPPLIES

The AFE5804 operates on three supply rails: a digital 1.8V supply, and the 3.3V and 5V analog supplies. At initial power-up, the part is operational in TGC mode, with the registers in the respective default configurations (see [Table 3](#)).

In TGC mode, only the VCA (attenuator) draws a low current (typically 7mA) from the 5V supply. Switching into the CW mode, the internal V/I-amplifiers are then powered from the 5V rail as well, raising the operating current on the 5V rail. At the same time, the post-gain amplifiers (PGA) are being powered down, thereby reducing the current consumption on the 3.3V rail (refer to the Electrical Characteristics table for details on TGC mode and CW mode current consumption).

All analog supply rails for the AFE5804 should be low noise, including the 3.3V digital supply DVDD that connects to the internal logic blocks of the VCA within the AFE5804. It is recommended to tie the DVDD pins to the same 3.3V analog supply as the AVDD1/2 pins, rather than a different 3.3V rail that may also provide power to other logic device in the system. Transients and noise generated by those devices can couple into the AFE5804 and degrade overall device performance.

## CLOCK JITTER, POWER NOISE, SNR, AND LVDS TIMING

As explained in Application Note [SLYT075](#), ADC clock jitter can degrade ADC performance. Therefore, it is always preferred to use a low jitter clock to drive the AFE5804. To ensure the performance of the AFE5804, a clock with a jitter of 1ps RMS or better is expected. However, it might not always be possible to achieve this for practical reasons. With a higher clock jitter, the SNR of the AFE5804 may be degraded as well as the LVDS timing stability. In addition, clean and stable power supplies are always preferred to maximize the AFE5804 SNR and ensure LVDS timing stability.

Poor RMS jitter (greater than 100ps), combined with inadequate power-supply design (for example, supply voltage drops and ripple increases), can affect LVDS timing. As a result, occasional glitches might be observed on the AFE5804 outputs. If this phenomenon is observed, or if the clock jitter and LVDD noise are concerns in the system, the registers in [Table 21](#) can be written as part of the initialization sequence in order to stabilize LVDS clock timing and SNR performance.

**Table 21. Address and Data in Hexadecimal**

ADDRESS	DATA
01	0010h
D1	0140h
DA	0001h
E1	0020h
02	0080h
01	0000h

Writing to these registers has the following additional effects:

- Total chip power increases approximately 8mW—this amount includes a current increase of about 1.9mA on AVDD1 and about 1.1mA on LVDD.
- With reference to the [LVDS Timing Diagram](#) and [Definition of Setup and Hold Times](#), LCLKP/LCLKM shift by about 100ps to the left relative to CLK and OUTP/OUTM. This shift causes the data setup time to reduce by 100ps and the data hold time to increase by 100ps.
- The clock propagation delay ( $t_{PROP}$ ) is reduced by roughly 2ns. The typical and minimum values for this specification are reduced by 2ns, and the maximum value for this spec is reduced by 1.5ns.

Power-supply noise can usually be minimized if grounding, bypassing, and PCB layout are well managed. Some guidelines can be found in the [Grounding and Bypassing](#) and [Board Layout](#) sections.

## GROUNDING AND BYPASSING

The AFE5804 distinguishes between three different grounds: AVSS1 and AVSS2 (analog grounds), and LVSS (digital ground). In most cases, it should be adequate to lay out the printed circuit board (PCB) to use a single ground plane for the AFE5804. Care should be taken that this ground plane is properly partitioned between various sections within the system to minimize interactions between analog and digital circuitry. Alternatively, the digital (LVDS) supply set consisting of the LVDD and LVSS pins can be placed on separate power and ground planes. For this configuration, the AVSS and LVSS grounds should be tied together at the power connector in a star layout.

All bypassing and power supplies for the AFE5804 should be referenced to this analog ground plane. All supply pins should be bypassed with 0.1 $\mu$ F ceramic chip capacitors (size 0603 or smaller). In order to minimize the lead and trace inductance, the capacitors should be located as close to the supply pins as possible. Where double-sided component mounting is allowed, these capacitors are best placed directly under the package. In addition, larger bipolar decoupling capacitors (2.2 $\mu$ F to 10 $\mu$ F, effective at lower frequencies) may also be used on the main supply pins. These components can be placed on the PCB in proximity (less than 0.5in or 12.7mm) to the AFE5804 itself.

The AFE5804 internally generates a number of reference voltages, such as the bias voltages (VB1 through VB6). Note that in order to achieve optimal low-noise performance, the VB1 pin must be bypassed with a capacitor value of at least 1 $\mu$ F; the recommended value for this bypass capacitor is 2.2 $\mu$ F. All other designed reference pins can be bypassed with smaller capacitor values, typically 0.1 $\mu$ F. For best results choose low-inductance ceramic chip capacitors (size 402) and place them as close as possible to the device pins as possible.

High-speed mixed signal devices are sensitive to various types of noise coupling. One primary source of noise is the switching noise from the serializer and the output buffer/drivers. For the AFE5804, care has been taken to ensure that the interaction between the analog and digital supplies within the device is kept to a minimal amount. The extent of noise coupled and transmitted from the digital and analog sections depends on the effective inductances of each of the supply and ground connections. Smaller effective inductance of the supply and ground pins leads to improved noise suppression. For this reason, multiple pins are used to connect each supply and ground sets. It is important to maintain low inductance properties throughout the design of the PCB layout by use of proper planes and layer thickness.

## BOARD LAYOUT

Proper grounding and bypassing, short lead length, and the use of ground and power-supply planes are particularly important for high-frequency designs. Achieving optimum performance with a high-performance device such as the AFE5804 requires careful attention to the PCB layout to minimize the effects of board parasitics and optimize component placement. A multilayer PCB usually ensures best results and allows convenient component placement.

In order to maintain proper LVDS timing, all LVDS traces should follow a controlled impedance design (for example, 100 $\Omega$  differential). In addition, all LVDS trace lengths should be equal and symmetrical; it is recommended to keep trace length variations less than 150mil (0.150in or 3.81mm).

Additional details on PCB layout techniques can be found in the Texas Instruments Application Report [MicroStar BGA Packaging Reference Guide \(SSYZ015B\)](#), which can be downloaded from the TI web site ([www.ti.com](http://www.ti.com)).

## REVISION HISTORY

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision B (November 2008) to Revision C</b>	<b>Page</b>
• Changed CW—Signal Channels, <i>Output transconductance</i> parameter symbol in Electrical Characteristics table .....	4
• Changed $t_{PROP}$ test conditions in 40MSPS/50MSPS LVDS Output Timing Characteristics table .....	13
• Changed $t_{PROP}$ test conditions in 30MSPS/20MSPS/10MSPS LVDS Output Timing Characteristics table .....	13
• Updated <a href="#">Figure 82</a> .....	27
• Added list item 3 and <a href="#">Table 2</a> to <i>Register Initialization</i> section .....	30
• Updated <a href="#">Figure 92</a> .....	30
• Updated footnote 2 of <a href="#">Table 3</a> .....	32
• Added last bullet item in list after <a href="#">Table 4</a> .....	34
• Changed $ADC\_RESET$ to $ADS\_RESET$ in second bullet of <i>VCA Reset</i> section .....	34
• Added <a href="#">Table 21</a> and updated <i>Clock Jitter, Power Noise, SNR, and LVDS Timing</i> section description .....	57

<b>Changes from Revision A (September 2008) to Revision B</b>	<b>Page</b>
• Changed VCM to $V_{CM}$ in <i>Internal Reference Voltages (ADC)</i> section of Electrical Characteristics table .....	4
• Corrected VCM pin name in functional block diagram .....	7
• Changed AVDD2 to AVDD1 in description column of L9 row of <a href="#">Table 1</a> .....	10
• Changed AVDD2 to AVDD1 in <a href="#">Figure 92</a> .....	30
• Corrected VCM pin name in <i>Summary of Features</i> table .....	33
• Changed VCM to CM in <i>External Reference</i> section .....	43
• Changed VCM to $V_{CM}$ in the <i>Analog-to-Digital Conversion</i> section .....	50
• Changed 30pF to 16pF in third paragraph of <i>Analog Input and LNA</i> section .....	51
• Changed VCM to $V_{CM}$ in third paragraph of <i>Clock Input</i> section .....	55
• Updated VCM to the proper pin name in <a href="#">Figure 106</a> .....	55
• Corrected VCM pin name in the <i>Reference Circuit</i> section .....	56
• Corrected VCMpin name in <a href="#">Table 20</a> .....	57
• Added <i>Clock Jitter, Power Noise, SNR, and LVDS Timing</i> section .....	57

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
AFE5804ZCF	ACTIVE	NFBGA	ZCF	135	160	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	0 to 70	AFE5804	<a href="#">Samples</a>
HPA01084ZCF	ACTIVE	NFBGA	ZCF	135	160	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR	0 to 70	AFE5804	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

ZCF (R-PBGA-N135)

PLASTIC BALL GRID ARRAY

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994 .
  - B. This drawing is subject to change without notice.
  - C. This is a lead-free solder ball design.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
