

---

## 155 Mbps to 4.25 Gbps LASER DRIVER

---

### FEATURES

- Multirate Operation From 155 Mbps up to 4.25 Gbps
- Bias Current Programmable From 1 mA to 100 mA
- Modulation Current Programmable From 5 mA to 85 mA
- APC and Fault Detection
- Fault Mode Selection
- Bias and Photodiode Current Monitors
- CML Data Inputs
- Temperature Compensation of Modulation Current
- Single 3.3-V Supply
- Surface-Mount, Small-Footprint, 4 mm × 4 mm 24-Lead QFN Package

### APPLICATIONS

- SONET/SDH Transmission Systems
- Fibre Channel Optical Modules
- Fiber Optic Data Links
- Digital Cross-Connects
- Optical Transmitters

### DESCRIPTION

The ONET4211LD is a laser driver for multiple fiber optic applications up to 4.25 Gbps. The device accepts CML input data and provides bias and modulation currents for driving a laser diode. Also provided are automatic power control (APC), temperature compensation of modulation current, fault detection, and current monitor features.

The device is available in a small-footprint, 4 mm × 4 mm 24-pin QFN package. The circuit requires a single 3.3-V supply.

This power-efficient laser driver is characterized for operation from –40°C to 85°C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## DETAILED DESCRIPTION

### BLOCK DIAGRAM

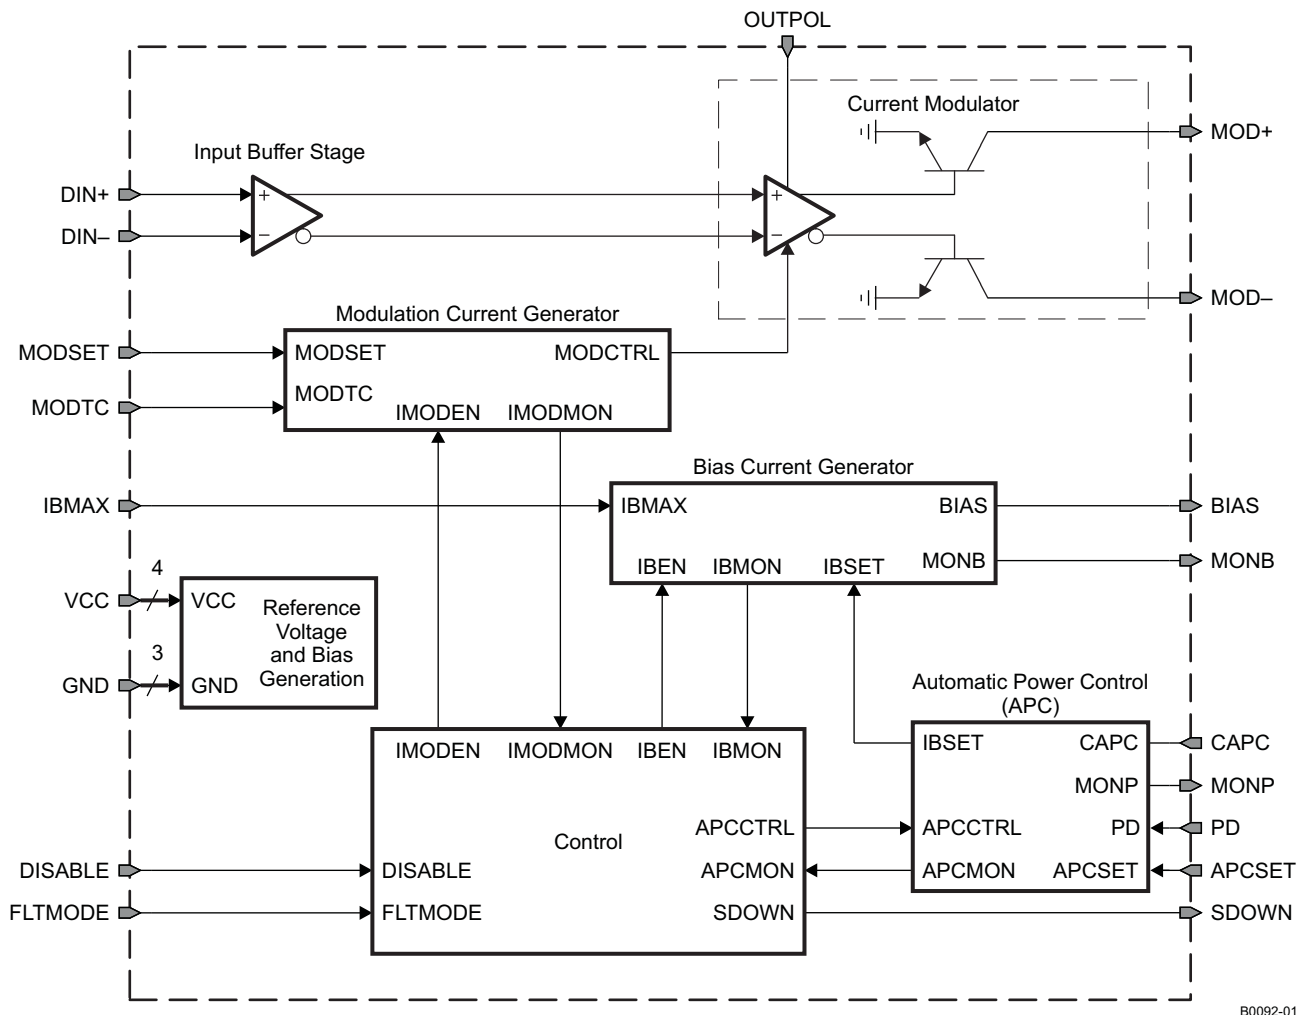

A simplified block diagram of the ONET4211LD is shown in [Figure 1](#).

This compact, low-power, 4.25-Gbps laser driver circuit consists of a high-speed data path and a bias-and-control block.

The function of the data path is to buffer the input data and then modulate the laser diode current according to the input data stream.

The bias-and-control block generates the laser diode bias current, contains automatic power control (APC) to maintain constant optical output power, generates a modulation current that can be temperature compensated, and controls power on during start-up and shutdown after failure detection. The circuit design is optimized for high-speed and low-voltage operation (3.3 V).

The main circuit blocks are described in detail in the following paragraphs.

B0092-01

**Figure 1. Simplified Block Diagram of the ONET4211LD**

## HIGH-SPEED DATA PATH

The high-speed data path consists of an input buffer stage and a current modulator.

The input buffer stage takes CML-compatible differential signals. It provides on-chip, 50-Ω termination to VCC. AC-coupling may be used at the DIN+ and DIN- inputs.

The laser diode current modulator consists mainly of two common-emitter output transistors and the required driver circuitry. According to the input data stream, the modulation current is sunk at the MOD+ or the MOD- pin.

Modulation current setting is performed by means of the modulation current generator block, which is supervised by the control circuit block.

The laser diode can be either ac- or dc-coupled. In either case, the maximum modulation current is 85 mA. The modulation output is optimized for driving a 20-Ω load.

For optimum power efficiency, the laser driver does not provide any on-chip back-termination.

## BIAS AND CONTROL

The bias-and-control circuitry consists of the bandgap voltage and bias generation block, the bias current generator, the automatic power control block, and the supervising control circuitry.

### BANDGAP VOLTAGE AND BIAS GENERATION

The bandgap voltage reference provides the process- and temperature-independent reference voltages needed to set bias current, modulation current, and photodiode reference current. Additionally, this block provides the biasing for all internal circuits.

### AUTOMATIC POWER CONTROL

The ONET4211LD laser driver incorporates an APC loop to compensate for the changes in laser threshold current over temperature and lifetime. The internal APC is enabled when resistors are connected to the IBMAX and APCSET pins. A back-facet photodiode mounted in the laser package is used to detect the average laser output power. The photodiode current  $I_{PD}$  that is proportional to the average laser power can be calculated by using the laser-to-monitor transfer ratio,  $\rho_{MON}$  and the average power,  $P_{AVG}$ :

$$I_{PD} [A] = P_{AVG} [W] \times \rho_{MON} [A/W] \quad (1)$$

In closed-loop operation, the APC modifies the laser diode bias current by comparing  $I_{PD}$  with a reference current  $I_{APCSET}$  and generates a bias compensation current.  $I_{PD}$  can be programmed by selecting the external resistor  $R_{APCSET}$  according to:

$$R_{APCSET} [\Omega] = \frac{4.69 V}{I_{PD} [A]} = \frac{4.69 V}{P_{AVG} [W] \times \rho_{MON} [A/W]} \quad (2)$$

The bias compensation current subtracts from the maximum bias current to maintain the monitor photodiode current. The maximum bias current is programmed by the resistor connected to IBMAX:

$$I_{BIASMAX} [A] = \frac{343 V}{R_{BIASMAX} [\Omega]} \quad (3)$$

An external pin, MONB, is provided as a bias current monitor output. A fraction of the bias current (1/68) is mirrored and develops a voltage drop across an external resistor to ground,  $R_{MONB}$ . The voltage at MONB is given as:

$$V_{MONB} [V] = \frac{R_{MONB} [\Omega] \times I_{BIAS} [A]}{68} \quad (4)$$

If the voltage at MONB is greater than the programmed threshold, a fault mode occurs.

MONP is also provided as a photocurrent monitor output. The photodiode current,  $I_{PD}$ , is mirrored and develops a voltage across an external resistor to ground,  $R_{MONP}$ . The voltage at MONP is given as:

$$V_{MONP} [V] = R_{MONP} [\Omega] \times I_{PD} [A] \quad (5)$$

If the voltage at MONP is greater than the programmed threshold, a fault mode occurs.

As with any negative-feedback system design, care must be taken to ensure stability of the loop. The loop bandwidth must not be too high, in order to minimize pattern-dependent jitter. The dominant pole is determined by the capacitor  $C_{APC}$ . The recommended value for  $C_{APC}$  is 200 nF. The capacitance of the monitor photodiode  $C_{PD}$  adds another pole to the system, and thus it must be small enough to maintain stability. The recommended value for this capacitance is  $C_{PD} \leq 50$  pF.

The internal APC loop can be disabled by connecting a 100-k $\Omega$  resistor from APCSET to VCC and leaving PD open. In open-loop operation, the laser diode current is set by  $I_{BIASMAX}$  and  $I_{MODSET}$ .

## MODULATION CURRENT GENERATOR

The modulation current generator defines the tail current of the modulator, which is sunk from either MOD+ or MOD–, depending on the data pattern. The modulation current consists of a current  $I_{MOD0}$  at a reference temperature  $T_0 = 60^\circ\text{C}$  (set by the resistor  $R_{MODSET}$ ) and a temperature-dependent modulation current defined by the resistor  $R_{MODTC}$ . The modulation current can be estimated as follows:

$$I_{MOD}[A] = \frac{265 \text{ V}}{R_{MODSET}[\Omega]} \times \left[ 1 + \left( \frac{24 \text{ } \Omega}{R_{MODTC}[\Omega]} + 630 \text{ ppm} \right) \times (T[^\circ\text{C}] - T_0[^\circ\text{C}]) \right] \quad (6)$$

Note that the reference temperature,  $T_0$ , and the temperature compensation set by  $R_{MODTC}$  vary from part to part. To reduce the variation,  $I_{MOD}$  can be calibrated over temperature and set with a microcontroller DAC or digital potentiometer.

## CONTROL

The function of this block is to control the start-up sequence, detect faults, detect tracking failure of the APC loop, and provide disable control. The laser driver has a controlled start-up sequence which helps prevent transient glitches from being applied to the laser during power on. At start-up, the laser diode is off, SDOWN is low, and the APC loop is open. Once  $V_{CC}$  reaches  $\sim 2.8$  V, the laser diode bias generator and modulation current generator circuitry are activated (if DISABLE is low). The slow-start circuitry gradually brings up the current delivered to the laser diode. From the time when  $V_{CC}$  reaches  $\sim 2.8$  V until the modulation current and bias current reach 95% of their steady state value, is considered the initialization time. If DISABLE is asserted during power on, the slow-start circuitry does not activate until DISABLE is negated.

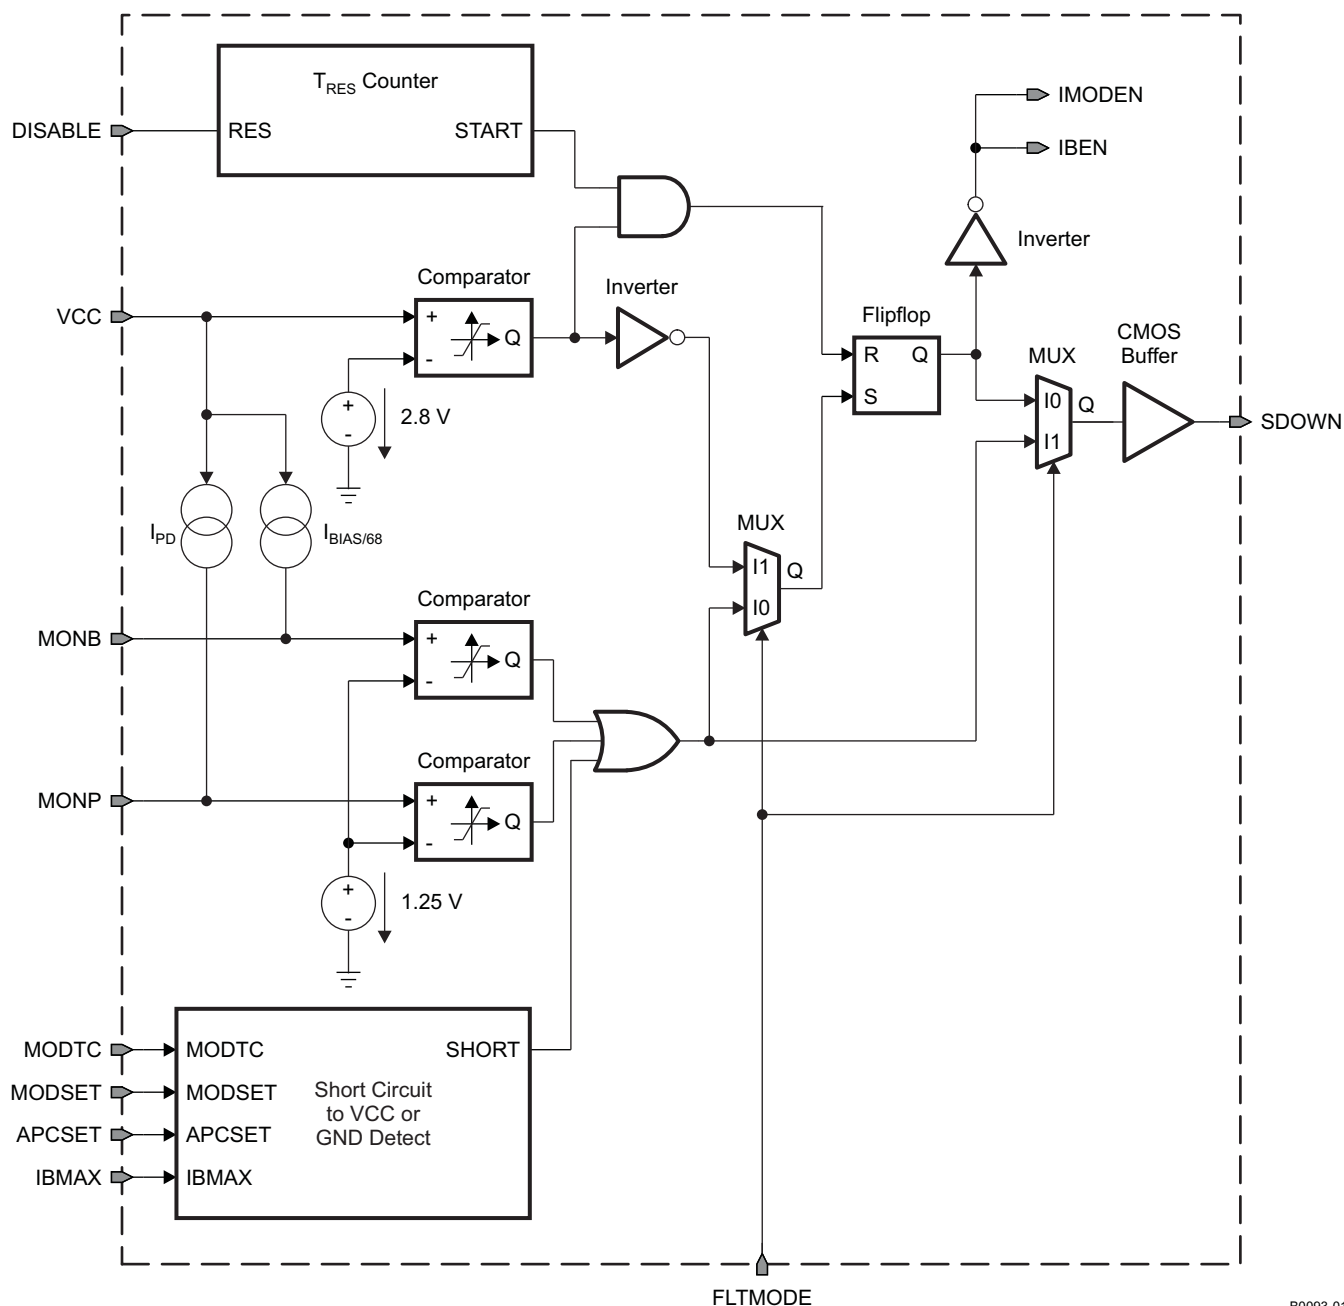

## FAULT DETECTION

The fault detection circuitry monitors the operation of the ONET4211LD. If FLTMODE is set to a low level, (hard-fault mode) this circuitry disables the bias and modulation circuits and latches the SDOWN output on detection of a fault. The fault mode is reset by toggling DISABLE (for a minimum time of  $T_{RES}$ ) or by toggling VCC.

Once DISABLE is toggled, SDOWN is set low and the circuit is re-initialized.

If FLTMODE is set to a high level (soft-fault mode), a fault is indicated at the SDOWN output; however, the bias and modulation circuits are not disabled. The SDOWN output is reset once the fault-causing condition disappears. Toggling DISABLE or VCC is not required.

A functional representation of the fault-detection circuitry is shown in [Figure 2](#).

### Figure 2. Functional Representation of the Fault Detection Circuitry

A fault mode is produced if the laser cathode is grounded and the photocurrent causes MONP to exceed its programmed threshold. Another fault mode can be produced if the laser diode end-of-life condition causes excessive bias current and photocurrent that results in monitor voltages (MONP, MONB) being greater than their programmed threshold. Other fault modes can occur if there are any I/O pin single-point failures (short to VCC or GND) and the monitor voltages exceed their programmed threshold (see [Table 1](#)).

**Table 1. Response to I/O-Pin Shorts to VCC or GND**

PIN	FLTMODE = LOW		FLTMODE = HIGH	
	Response to Short to GND	Response to Short to V <sub>CC</sub>	Response to Short to GND	Response to Short to V <sub>CC</sub>
APCSET	SDOWN latched high, I <sub>BIAS</sub> and I <sub>MOD</sub> disabled	No fault, I <sub>MOD</sub> unaffected	SDOWN high, I <sub>BIAS</sub> and I <sub>MOD</sub> unaffected	No fault
BIAS	SDOWN latched high, I <sub>MOD</sub> disabled	No fault, I <sub>BIAS</sub> goes to zero	SDOWN high, I <sub>MOD</sub> unaffected	No fault, I <sub>MOD</sub> unaffected
CAPC	No fault	No fault, I <sub>BIAS</sub> goes to zero	No fault, I <sub>MOD</sub> unaffected	No fault, I <sub>BIAS</sub> goes to zero
DIN+	No fault, I <sub>MOD</sub> disabled	No fault	No fault, I <sub>MOD</sub> disabled	No fault
DIN–	No fault, I <sub>MOD</sub> disabled	No fault	No fault, I <sub>MOD</sub> disabled	No fault
DISABLE	Normal circuit operation	Normal circuit operation	Normal circuit operation	Normal circuit operation
IBMAX	SDOWN latched high, I <sub>BIAS</sub> and I <sub>MOD</sub> disabled	SDOWN latched high, I <sub>BIAS</sub> and I <sub>MOD</sub> disabled	SDOWN high, I <sub>MOD</sub> unaffected	SDOWN high, I <sub>MOD</sub> unaffected
MOD+	SDOWN latched high, I <sub>BIAS</sub> and I <sub>MOD</sub> disabled	No fault	SDOWN high, I <sub>BIAS</sub> unaffected	No fault
MOD–	SDOWN latched high, I <sub>BIAS</sub> and I <sub>MOD</sub> disabled	No fault	SDOWN high, I <sub>BIAS</sub> unaffected	No fault
MODSET	SDOWN latched high, I <sub>BIAS</sub> and I <sub>MOD</sub> disabled	No fault, I <sub>MOD</sub> disabled	SDOWN high, I <sub>BIAS</sub> unaffected	No fault, I <sub>MOD</sub> disabled
MODTC	SDOWN latched high, I <sub>BIAS</sub> and I <sub>MOD</sub> disabled	No fault	SDOWN high, I <sub>BIAS</sub> and I <sub>MOD</sub> unaffected	No fault
MONB	No fault	SDOWN latched high, I <sub>BIAS</sub> and I <sub>MOD</sub> disabled	No fault	SDOWN high, I <sub>BIAS</sub> and I <sub>MOD</sub> unaffected
MONP	No fault	SDOWN latched high, I <sub>BIAS</sub> and I <sub>MOD</sub> disabled	No fault	SDOWN high, I <sub>BIAS</sub> and I <sub>MOD</sub> unaffected

## PACKAGE

For the ONET4211LD, a small-footprint, 4-mm × 4-mm, 24-lead QFN package is used, with a lead pitch of 0,5 mm. The pinout is shown in [Figure 3](#).

To achieve the required low thermal resistance of about 38 K/W, which keeps the maximum junction temperature below 115°C, a good thermal connection of the exposed die pad is mandatory.

P0024-03

**Figure 3. Pinout of the ONET4211LD in a 4-mm × 4-mm, 24-Lead QFN Package (Top View)**

### TERMINAL FUNCTIONS

TERMINAL NAME	NO.	TYPE	DESCRIPTION
APCSET	23	Analog-in	Set photodiode reference current with resistor to GND.
BIAS	13	Analog-out	Laser-diode bias-current sink. Connect to laser cathode.
CAPC	20	Analog	APC loop capacitor
DIN+	3	CML-in	Non-inverted data input. On-chip, 50-Ω terminated to VCC.
DIN–	4	CML-in	Inverted data input. On-chip, 50-Ω terminated to VCC.
DISABLE	24	LVTTL-in	Disable modulation and bias-current outputs.
FLTMODE	10	CMOS-in	Fault mode selection input. If a low level is applied to this pin, any fault event is latched and the bias and modulation currents are disabled in a fault condition. Toggling of DISABLE or VCC resets the fault condition. If pin is set to a high level, fault events are flagged at the SDOWN output but not latched. The bias and modulation currents are not disabled. SDOWN is reset once the fault condition disappears.
GND	1, 6, 18, EP	Supply	Circuit ground. The exposed die pad (EP) must be grounded.
IBMAX	21	Analog-in	Set maximum laser diode current with resistor to GND.
MOD+	15	Analog-out	Laser modulation current output. Connect to laser cathode. Avoid usage of vias on board.
MOD–	16	Analog-out	Complementary laser modulation current output. Connect to VCC adjacent to anode of laser diode. Avoid usage of vias on board.
MODSET	11	Analog-in	Set temperature-independent modulation current with resistor to GND.
MODTC	12	Analog-in	Set modulation-current temperature compensation with resistor to GND.
MONB	8	Analog-out	Bias current monitor. Sources 1/68 of the bias current.
MONP	7	Analog-out	Photodiode current monitor. Sources a current identical to the photodiode current.
OUTPOL	22	LVTTL-in	Alters modulation current output polarity. Open or high: normal polarity; low: inverted polarity. OUTPOL is pulled up internally. Normal polarity: when DIN+ is high, current is sunk into MOD+.
PD	19	Analog-in	Monitor photodiode input. Connect to photodiode anode for APC. Sinks the photodiode current to GND.
SDOWN	9	LVTTL-out	Fault detection flag
VCC	2, 5, 14, 17	Supply	3.3-V, ±10% supply voltage

**ABSOLUTE MAXIMUM RATINGS**over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

V <sub>CC</sub>	Supply voltage <sup>(2)</sup>	–0.3 V to 4 V
I <sub>BIAS</sub>	Current into BIAS	–20 mA to 120 mA
I <sub>IMOD+</sub> , I <sub>IMOD–</sub>	Current into MOD+, MOD–	–20 mA to 120 mA
I <sub>PD</sub>	Current into PD	–5 mA to 5 mA

## APPLICATION INFORMATION

Figure 25 shows the ONET4211LD connected with a dc-coupled interface to the laser diode; alternatively, the ONET4211LD laser driver can be ac-coupled.

S0154-01

**Figure 25. Basic Application Circuit With DC-Coupled Interface Between the ONET4211LD and the Laser Diode**

APC loop instability can occur with large inductive loading on the BIAS pin. To ensure loop stability in this case, it is recommended to connect a 1-nF capacitor to ground at the BIAS pin.

## SELECT A LASER

In the design example according to [Figure 25](#), the ONET4211LD is dc-coupled to a typical communication-grade laser diode capable of operating at 4.25 Gb/s with the following specifications shown in [Table 2](#).

**Table 2. Laser Diode Specifications**

PARAMETER		VALUE	UNITS
$\lambda$	Wavelength	1310	nm
$P_{AVG}$	Average Optical Output Power	5	mW
$I_{TH}$	Threshold current	10	mA
$\rho_{MON}$	Laser-to-monitor transfer	0.05	mA/mW
$\eta$	Laser slope efficiency	0.2	mW/mA

## SELECT APCSET RESISTOR

When the APC loop is activated, the desired average optical output power  $P_{AVG}$  is defined by characteristics of the monitor diode and by the APCSET resistor  $R_{APCSET}$ . The relation between the monitor photodiode current  $I_{PD}$  and the average optical output power  $P_{AVG}$  is given by [Equation 7](#):

$$I_{PD} [A] = P_{AVG} [W] \times \rho_{MON} [A/W] \quad (7)$$

The  $R_{APCSET}$  resistor is calculated by [Equation 8](#):

$$R_{APCSET} [\Omega] = \frac{4.69 V}{I_{PD} [A]} = \frac{4.69 V}{P_{AVG} [W] \times \rho_{MON} [A/W]} \quad (8)$$

For the laser diode specified in [Table 2](#) and the desired average optical output power of 5 mW,  $R_{APCSET}$  is calculated as in [Equation 9](#):

$$R_{APCSET} [\Omega] = \frac{4.69 V}{P_{AVG} [W] \times \rho_{MON} [A/W]} = \frac{4.69 V}{5 \text{ mW} \times 0.05 \text{ mA/mW}} = 18.75 \text{ k}\Omega \quad (9)$$

Note that the monitor photodiode current  $I_{PD}$  must not exceed 1.5 mA, corresponding to a minimum APCSET resistor  $R_{APCSET, MIN} = 3.1 \text{ k}\Omega$ .

## SELECT MODSET RESISTOR

Modulation current  $I_{MOD}$  is dependent on the required optical output peak-to-peak power  $P_{p-p}$  or the average optical power  $P_{AVG}$ .  $I_{MOD}$  can be calculated using the laser slope efficiency  $\eta$  and the desired extinction ratio  $r_e$ :

$$I_{MOD} [A] = \frac{P_{p-p} [W]}{\eta [W/A]} = \frac{2 \times P_{AVG} [W] \times \frac{r_e - 1}{r_e + 1}}{\eta [W/A]} \quad (10)$$

Using the laser diode parameters from [Table 2](#) and assuming an extinction ratio  $r_e = 8 \text{ dB}$  (X6.3) for an average optical power  $P_{AVG} = 5 \text{ mW}$ , the required modulation current results as:

$$I_{MOD} = \frac{2 \times 5 \text{ mW} \times \frac{6.3 - 1}{6.3 + 1}}{0.2 \text{ mW/mA}} = 36.3 \text{ mA} \quad (11)$$

The modulation current is adjustable, with a selectable temperature coefficient TC according to the relation:

$$I_{MOD} [A] = I_{MOD0} [A] \times \left( 1 + TC \times (T [^{\circ}\text{C}] - T_0 [^{\circ}\text{C}]) \right) \quad (12)$$

where  $T$  is the ambient temperature in  $^{\circ}\text{C}$  and  $T_0$  is the reference temperature ( $T_0 = 60^{\circ}\text{C}$ ).

The temperature coefficient TC of the modulation current is typically adjustable between 630 ppm/ $^{\circ}\text{C}$  and 8300 ppm/ $^{\circ}\text{C}$ .

For calculation of the required external resistor  $R_{MODSET}$  for a given modulation current and a given temperature, the formula can be modified as follows:

$$R_{\text{MODSET}}[\Omega] = \frac{265 \text{ V}}{I_{\text{MOD}}[\text{A}]} \times \left( 1 + \text{TC} \times (T[^\circ\text{C}] - T_0[^\circ\text{C}]) \right) \quad (13)$$

If 4000 ppm/°C is the desired temperature coefficient and the modulation current from the preceding example, 36.3 mA, is required at a temperature of 25°C, the MODSET resistor  $R_{\text{MODSET}}$  is given by [Equation 14](#).

$$R_{\text{MODSET}}[\Omega] = \frac{265 \text{ V}}{36.3 \text{ mA}} \times \left( 1 + \frac{4000 \text{ ppm}}{^\circ\text{C}} \times (25^\circ\text{C} - 60^\circ\text{C}) \right) = 6.3 \text{ k}\Omega \quad (14)$$

Note that the modulation current  $I_{\text{MOD}}$  must not exceed 85 mA over the complete temperature range, corresponding to a minimum MODSET resistor  $R_{\text{MODSET,MIN}} = 3.1 \text{ k}\Omega$ .

## SELECT MODTC RESISTOR

The  $R_{\text{MODTC}}$  resistor is used to program a modulation temperature coefficient that can be used to compensate for the decreased slope efficiency of the laser at a higher temperature. The temperature coefficient  $\text{TC}_{\text{LD}}$  of the laser can be calculated using the slope efficiency  $\eta_1$  at temperature  $T_1$  and  $\eta_2$  at temperature  $T_2$  as shown in [Equation 15](#):

$$\text{TC}_{\text{LD}} \left[ \frac{1}{^\circ\text{C}} \right] = \frac{\eta_2[\text{W/A}] - \eta_1[\text{W/A}]}{\eta_1[\text{W/A}] \times (T_2[^\circ\text{C}] - T_1[^\circ\text{C}])} \times 10^6 \quad (15)$$

As an example, for the laser in [Table 2](#), the slope efficiency at temperature  $T_1 = 25^\circ\text{C}$  is  $\eta_1 = 0.2 \text{ mW/mA}$ . At temperature  $T_2 = 85^\circ\text{C}$ , the slope efficiency is  $\eta_2 = 0.15 \text{ mW/mA}$ . The corresponding temperature coefficient  $\text{TC}_{\text{LD}}$  of the laser can be calculated:

$$\text{TC}_{\text{LD}} = \frac{0.15 \text{ mW/mA} - 0.2 \text{ mW/mA}}{0.2 \text{ mW/mA} \times (85^\circ\text{C} - 25^\circ\text{C})} \times 10^6 = -4167 \frac{1}{^\circ\text{C}} \quad (16)$$

The MODTC resistor  $R_{\text{MODTC}}$  can be used to compensate the laser temperature coefficient  $\text{TC}_{\text{LD}}$  in order to maintain the same optical output swing within a range of 630 ppm up to 8300 ppm. For this,  $R_{\text{MODTC}}$  may be programmed as follows:

$$R_{\text{MODTC}} = \frac{24 \Omega}{(\text{TC} - 630 \text{ ppm}) \times \left[ \frac{1}{^\circ\text{C}} \right] \times ^\circ\text{C}} \quad (17)$$

To compensate for the decreased slope efficiency of the laser in [Table 2](#), TC must be 4167 ppm/°C.

This leads to the following MODTC resistor  $R_{\text{MODTC}}$ :

$$R_{\text{MODTC}} = \frac{24 \Omega}{\frac{4167 \text{ ppm} - 630 \text{ ppm}}{^\circ\text{C}} \times ^\circ\text{C}} = 6.8 \text{ k}\Omega \quad (18)$$

## SELECT BIASMAX RESISTOR

The BIASMAX resistor  $R_{\text{BIASMAX}}$  is used to limit the bias current applied to the laser diode.

To calculate  $R_{\text{BIASMAX}}$ , the maximum threshold current at 85°C and end of life must be determined. The maximum bias current for the dc-coupled interface can be approximated by [Equation 19](#).

$$I_{\text{BIASMAX}}[\text{A}] = I_{\text{THMAX}}[\text{A}] \quad (19)$$

$R_{\text{BIASMAX}}$  can be set by [Equation 20](#).

$$R_{\text{BIASMAX}}[\Omega] = \frac{343 \text{ V}}{I_{\text{BIASMAX}}[\text{A}]} = \frac{343 \text{ V}}{I_{\text{THMAX}}[\text{A}]} \quad (20)$$

For the example laser diode, the maximum threshold current is 40 mA at 85°C. Therefore,  $R_{\text{BIASMAX}}$  can be approximated by [Equation 21](#).

$$R_{BIASMAX} = \frac{343 \text{ V}}{40 \text{ mA}} = 8.6 \text{ k}\Omega \quad (21)$$

### SELECT $V_{MONB}$ AND $V_{MONP}$ RANGE

Monitoring the bias current is achieved by taking the fractional (1/68) bias current and developing a voltage across an external resistor to ground. [Equation 22](#) provides the value for  $V_{MONB}$  for a resistor value equal to 768  $\Omega$ .

$$V_{MONB}[V] = \frac{R_{MONB}[\Omega] \times I_{BIAS}[A]}{68} = \frac{768 \Omega \times I_{BIAS}[A]}{68} = 11.29 \Omega \times I_{BIAS}[A] \quad (22)$$

Monitoring of the photo current is achieved by taking a mirror of  $I_{PD}$  and developing a voltage across an external resistor to ground. [Equation 23](#) provides the value for  $V_{MONP}$  for a resistor equal to 200  $\Omega$ .

$$V_{MONP}[V] = R_{MONP}[\Omega] \times I_{PD}[A] = 200 \Omega \times I_{PD}[A] \quad (23)$$

### LASER DIODE INTERFACE

The output stage of the ONET4211LD is optimized for driving a 20- $\Omega$  load. The combination of a damping resistor,  $R_D$ , along with the resistance of the laser diode, must be 20  $\Omega$  for impedance matching. The suggested typical value for  $R_D$  is 6  $\Omega$  to 15  $\Omega$ . A bypass capacitor of 10 nF placed close to the laser anode also helps to optimize performance.

## Revision History

Changes from Original (November 2006) to Revision A	Page
• Changed Disable negate time From: Typ = 200 To: Typ = 80 .....	10
• Changed Time to initialize From: Typ = 200 To: Typ = 80 .....	10
• Changed DISABLE reset Maximum spike pulse From: Max = 10 To: Max = 0.8 .....	10
• Changed DISABLE high time From: Min = 20 To: Max = 6 .....	10

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ONET4211LDRGER	ACTIVE	VQFN	RGE	24	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	ONET 4211L	<a href="#">Samples</a>
ONET4211LDRGET	ACTIVE	VQFN	RGE	24	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	ONET 4211L	<a href="#">Samples</a>
ONET4211LDRGETG4	ACTIVE	VQFN	RGE	24	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	ONET 4211L	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

---

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

NOTES: A. All linear dimensions are in millimeters

RGE (S-PVQFN-N24)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

## IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
