

IntelliMAX™ Advanced Load Management Products

FPF1005 - FPF1006

General Description

The FPF1005 & FPF1006 are low R_{DS} P-Channel MOSFET load switches with CMOS controlled turn-on targeting small package load switch applications. The input voltage range operates from 1.2 V to 5.5 V. Switch control is by a logic input (ON) capable of interfacing directly with low voltage control signals. In FPF1006, 120 Ω on-chip load resistor is added for output quick discharge when switch is turned off.

Both FPF1005 & FPF1006 are available in a small 2X2 MicroFET-6 pin plastic package.

Features

- 1.2 to 5.5 V Input Voltage Range
- Typical $R_{DS(ON)} = 50 \text{ m}\Omega$ @ $V_{IN} = 5.5 \text{ V}$
- Typical $R_{DS(ON)} = 55 \text{ m}\Omega$ @ $V_{IN} = 3.3 \text{ V}$
- ESD Protected, above 2000 V HBM
- These Devices are Pb-Free and are RoHS Compliant

Applications

- PDAs
- Cell Phones
- GPS Devices
- MP3 Players
- Digital Cameras
- Peripheral Ports
- Hot Swap Supplies
- RoHS Compliant

DESCRIPTION OF OPERATION

The FPF1005 & FPF1006 are low $R_{DS(ON)}$ P-Channel load switches with controlled turn-on. The core of each device is a 55 m Ω P-Channel MOSFET and a controller capable of functioning over a wide input operating range of 1.2–5.5 V. The ON pin, an active HI TTL compatible input, controls the state of the switch. The FPF1006 contains a

120 Ω on-chip load resistor for quick output discharge when the switch is turned off.

However, V_{OUT} pin of FPF1006 should not be connected directly to the battery source due to the discharge mechanism of the load switch.

APPLICATION INFORMATION

Typical Application

Figure 22. Typical Application

Input Capacitor

To limit the voltage drop on the input supply caused by transient in-rush currents when the switch turns-on into a discharged load capacitor or a short-circuit, a capacitor needs to be placed between V_{IN} and GND. A 1 μ F ceramic capacitor, C_{IN} , placed close to the pins is usually sufficient. Higher values of C_{IN} can be used to further reduce the voltage drop during higher current application.

Output Capacitor

A 0.1 μ F capacitor, C_{OUT} , should be placed between V_{OUT} and GND. This capacitor will prevent parasitic board inductance from forcing V_{OUT} below GND when the switch turns-off. Due to the integral body diode in the PMOS switch, a C_{IN} greater than C_{OUT} is highly recommended. A C_{OUT} greater than C_{IN} can cause V_{OUT} to exceed V_{IN} when the system supply is removed. This could result in current flow through the body diode from V_{OUT} to V_{IN} .

Board Layout

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effects that parasitic trace inductance may have on normal and short-circuit operation. Using wide traces or large copper planes for all pins (V_{IN} , V_{OUT} , ON and GND) will help minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance.

Evaluation Board Layout

FPF1005/6 Demo board has the components and circuitry to demonstrate the load switch functions. Thermal performance of the load switch can be improved significantly by connecting the middle pad (pin 7) to the GND area of the PCB.
