

16-Mbit (1 M × 16) Static RAM

Features

- Very high speed: 55 ns
- Wide voltage range: 1.65 V to 2.25 V
- Ultra low standby power
 - Typical standby current: 1.5 μ A
 - Maximum standby current: 12 μ A
- Ultra low active power
 - Typical active current: 2.2 mA at f = 1 MHz
- Easy memory expansion with \overline{CE}_1 , CE_2 , and \overline{OE} features
- Automatic power down when deselected
- CMOS for optimum speed and power
- Offered in Pb-free 48-ball very fine ball grid array (VFBGA) packages

Functional Description

The CY62167EV18 is a high performance CMOS static RAM organized as 1M words by 16 bits. This device features advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an

automatic power down feature that reduces power consumption by 99 percent when addresses are not toggling. Place the device into standby mode when deselected (\overline{CE}_1 HIGH or CE_2 LOW or both \overline{BHE} and \overline{BLE} are HIGH). The input and output pins (I/O_0 through I/O_{15}) are placed in a high impedance state when: the device is deselected (\overline{CE}_1 HIGH or CE_2 LOW); outputs are disabled (\overline{OE} HIGH); both Byte High Enable and Byte Low Enable are disabled (\overline{BHE} , \overline{BLE} HIGH); and a write operation is in progress (CE_1 LOW, CE_2 HIGH and \overline{WE} LOW).

To write to the device, take Chip Enables (\overline{CE}_1 LOW and CE_2 HIGH) and Write Enable (\overline{WE}) input LOW. If Byte Low Enable (\overline{BLE}) is LOW, then data from I/O pins (I/O_0 through I/O_7) is written into the location specified on the address pins (A_0 through A_{19}). If Byte High Enable (\overline{BHE}) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{19}).

To read from the device, take Chip Enables (\overline{CE}_1 LOW and CE_2 HIGH) and Output Enable (\overline{OE}) LOW while forcing the Write Enable (\overline{WE}) HIGH. If Byte Low Enable (\overline{BLE}) is LOW, then data from the memory location specified by the address pins appears on I/O_0 to I/O_7 . If Byte High Enable (\overline{BHE}) is LOW, then data from memory appears on I/O_8 to I/O_{15} . See the Truth Table on page 11 for a complete description of read and write modes.

Notes

1. NC pins are not connected on the die.
2. Ball H6 for the VFBGA package can be used to upgrade to a 32 M density.
3. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC(typ)}, T_A = 25 °C.
4. This part can be operated in the V_{CC} range of 1.65 V–2.25 V at 55ns speed. It can also be operated in the V_{CC} range of 2.2 V–3.6 V at 45ns speed.

Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.

Storage temperature -65 °C to + 150 °C

Ambient temperature with power applied -55 °C to + 125 °C

Supply voltage to ground potential -0.2 V to 2.45 V ($V_{CC(max)}$ + 0.2 V)

Notes

5. $V_{IL}(min) = -2.0$ V for pulse durations less than 20 ns.

6. $V_{IH}(max) = V_{CC} + 0.75$ V for pulse durations less than 20 ns.

7. Full Device AC operation is based on a 100 μs ramp time from 0 to $V_{CC}(min)$ and 200 μs wait time after V_{CC} stabilization.

8. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at $V_{CC} = V_{CC}(typ)$, $T_A = 25$ °C.

9. Chip enables (\overline{CE}_1 and CE_2), and byte enables (BHE and BLE) must be tied to CMOS levels to meet the I_{SB1} / I_{SB2} / I_{CCDR} spec. Other inputs can be left floating.

Notes

16. In an earlier revision of this device, under a specific application condition, READ and WRITE operations were limited to switching of the byte enable and/or chip enable signals as described in the Application Notes AN13842 and AN66311. However, the issue has been fixed and in production now, and hence, these Application Notes are no longer applicable. They are available for download on our website as they contain information on the date code of the parts, beyond which the fix has been in production.
17. Test conditions for all parameters other than tri-state parameters are based on signal transition time of 1 V/ns, timing reference levels of V_{CC(typ)}/2, input pulse levels of 0 to V_{CC(typ)}, and output loading of the specified I_{OL}/I_{OH} as shown in Figure 2 on page 5.
18. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE}, t_{HZBE} is less than t_{LZBE}, t_{HZOE} is less than t_{LZOE}, and t_{HZWE} is less than t_{LZWE} for any given device.
19. t_{HZOE}, t_{HZCE}, t_{HZBE}, and t_{HZWE} transitions are measured when the output enters a high impedance state.
20. The internal memory write time is defined by the overlap of WE, CE₁ = V_{IL}, BHE and/or BLE = V_{IL}, and CE₂ = V_{IH}. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
21. The minimum write cycle pulse width for Write Cycle No. 3 (WE controlled, OE LOW) should be equal to the sum of t_{SD} and t_{HZWE}.

Switching Waveforms

Figure 5. Read Cycle No. 2 (\overline{OE} Controlled)^[23, 24]

Notes

- 22. The device is continuously selected. \overline{OE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} , \overline{BLE} or both = V_{IL} , and $CE_2 = V_{IH}$.
- 23. WE is HIGH for read cycle.
- 24. Address valid before or similar to \overline{CE}_1 , \overline{BHE} , \overline{BLE} transition LOW and CE_2 transition HIGH.

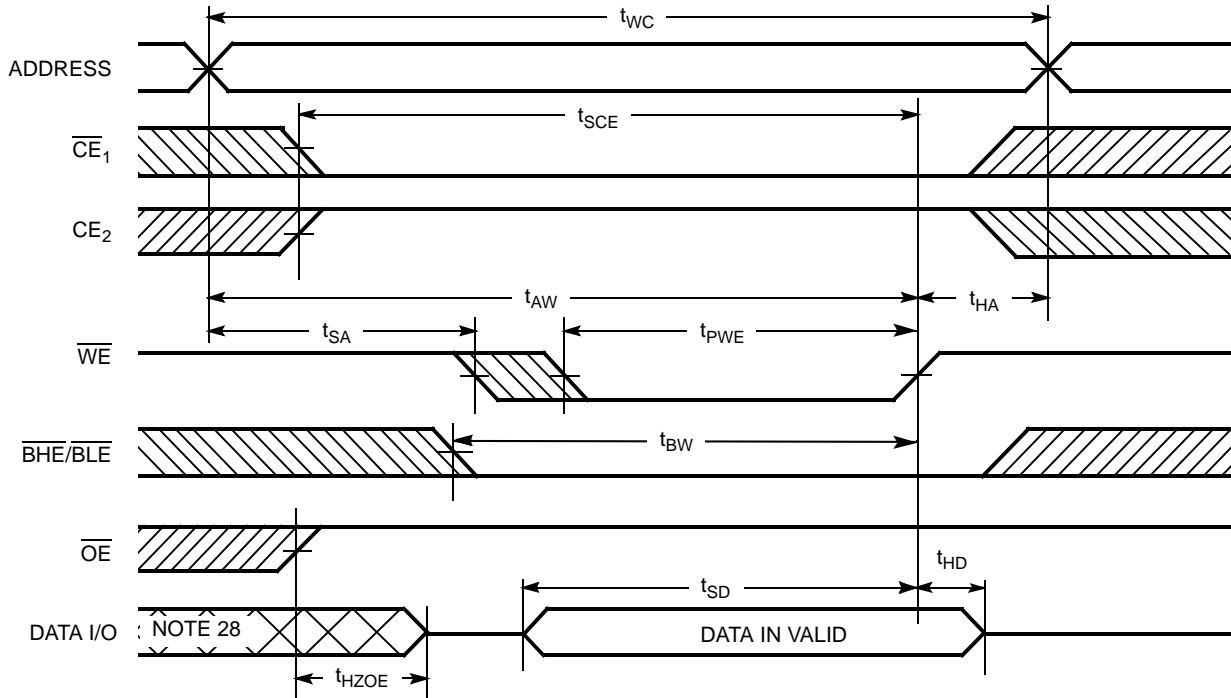

Figure 7. Write Cycle No. 2 (\overline{CE}_1 or \overline{CE}_2 Controlled) [25, 26, 27]

Notes

- 25. The internal memory write time is defined by the overlap of \overline{WE} , $\overline{CE}_1 = V_{IL}$, \overline{BHE} and/or $\overline{BLE} = V_{IL}$, and $CE_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
- 26. Data I/O is high impedance if $OE = V_{IH}$.
- 27. If \overline{CE}_1 goes HIGH and \overline{CE}_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.
- 28. During this period the I/Os are in output state. Do not apply input signals.

Switching Waveforms (continued)

Figure 9. Write Cycle No. 4 ($\overline{BHE}/\overline{BLE}$ Controlled) [29]

Notes

29. If \overline{CE}_1 goes HIGH and CE_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.

30. During this period the I/Os are in output state. Do not apply input signals.

31. The minimum write cycle pulse width should be equal to the sum of t_{SD} and t_{HZWE} .
